About This Book

This manual provides information on the subroutines available in the graPHIGS API for creating graphical application programs. It is a reference manual containing the information you need to code your calls and to declare variables correctly, and it is intended to be used in conjunction with the other books in the graPHIGS API library. For example, the concepts and techniques employed in graphics programming are described in *The graPHIGS Programming Interface: Understanding Concepts (POWER-based System Only)*; specific information about device support capabilities, such as prompt/echo types for input devices, is provided in *The graPHIGS Programming Interface: Technical Reference (POWER-based System Only)*.

Each subroutine listed in this manual has information about error codes and functional relations to help you identify more readily the source of errors resulting from data, program flow. Each subroutine description explains the result to the subroutine call and a list of the errors associated with the subroutine. (See Appendix B. ″Error Processing″ for general information regarding errors and error processing. See *The graPHIGS Programming Interface: Understanding Concepts (POWER-based System Only)* and *The graPHIGS Programming Interface: Messages and Codes (POWER-based System Only)* for more detailed information regarding errors and error processing.)

Who Should Use This Book

This book is intended for application programmers.

Highlighting

The following highlighting conventions are used in this book:

Bold	Identifies commands, subroutines, keywords, files, structures, directories, and other items whose names are predefined by the system. Also identifies graphical objects such as buttons, labels, and icons that the user selects.
Italics	Identifies parameters whose actual names or values are to be supplied by the user.
`Monospace`	Identifies examples of specific data values, examples of text similar to what you might see displayed, examples of portions of program code similar to what you might write as a programmer, messages from the system, or information you should actually type.

ISO 9000

ISO 9000 registered quality systems were used in the development and manufacturing of this product.

Chapter 1. Introduction

This manual describes the syntax and operations of the subroutines available in the graPHIGS API interface.

Calling Conventions for Subroutines

The graPHIGS API can be invoked from a number of programming languages. (To obtain language specific information, see *The graPHIGS Programming Interface: Writing Applications*.

Each invocation consists of the subroutine name with the appropriate parameters required by the subroutine. The graPHIGS API subroutine names are up to six characters long. Mnemonic conventions make the purpose of the subroutine calls evident in the names. Each subroutine name includes the 2-character prefix "GP" and the initial letter or letters from words in the subroutine name. All parameters must be specified in each subroutine and must be in the order shown in the subroutine description.

Request Control Parameter Codes

The Request Control Parameter (RCP) codes give alternative access to the graPHIGS API subroutines. These codes comprise a system programmer's interface (SPI) which provides a common entry point (AFMASP) for the graPHIGS API. For more information on using the SPI, see *The graPHIGS Programming Interface: Writing Applications*.

graPHIGS API Subroutines

For each graPHIGS API subroutine, you will find a description of the subroutine, its purpose, the processing performed, a list and description of the parameters, a list of associated error codes and messages, a list of related subroutines, and the associated RCP code (used only in programming for the System Programming Interface).

The graPHIGS API subroutine groups are as follows:
1. Control
2. Output Primitives
3. Attribute Structure Elements
4. Miscellaneous Structure Elements
5. Structure Operations
6. Archive
7. Workstation Table Operations
8. Display
9. Transformation
10. Input
11. Font
12. Image
13. Utility
14. Error Handling
15. Miscellaneous
16. Inquire
17. Compatibility
18. Distributed Application Processing (DAP)
19. Explicit Traversal

Subroutine Descriptions

The page preceding each group of subroutines presents a brief overview of the purpose and result caused by invoking the subroutines referenced within the given section. This introductory material highlights important information that applies to all the subroutines in that section.

Reference Manual Abbreviations

The following abbreviations are used frequently:

ADIB Application Defaults Interface Block.

ARCL Archive Closed.

AROP Archive Open.

ASAP As Soon As Possible.

ASF Attribute Source Flag.

ASTI At Some Time.

BNIG Before Next Interaction Globally.

BNIL Before Next Interaction Locally.

CMY Cyan-Magenta-Yellow color model.

CSID Character Set Identifier.

EDF External Defaults File.

HSV Hue-Saturation-Value color model.

NDT Nucleus Descriptor Table.

NROP Non-Retained Structure Open.

NSL Nucleus State List.

PDT graPHIGS API Description Table.

PHCL graPHIGS Closed.

PHOP graPHIGS Open.

PSL graPHIGS API State List.

RGB Red-Green-Blue color model.

SSCL Structure Store Close.

SSL Structure Store State List.

SSOP Structure Store Open.

STCL Structure Closed.

STOP Structure Open.

UQUM
  Quick Update Method.

USL Utility State List.

WAIT When Application Requests It.

WDO Workstation-Dependent Output.

WDT Workstation Description Table.

WSCL Workstation Closed.

WSID Workstation Identifier.

WSL Workstation State List.

WSOP
  Workstation Open.

WSSL Workstation Selected.

WSTYPE
  Workstation Type.

The following abbreviations for coordinate spaces are used:

DC Device Coordinates

MC Modeling Coordinates

NPC Normalized Projection Coordinates

VC Viewing Coordinates

WC World Coordinates

WU Window Units

> **Note:** For more information, see *The graPHIGS Programming Interface: Understanding Concepts*.

Chapter 2. Control Subroutines

The control subroutines allow your application to have access to and control over the graphical resources available when using the graPHIGS API (*).

You can open and close the graPHIGS API and invoke the diagnostic trace for debugging.

When an application opens the graPHIGS API, a *nucleus*, which is the collection of resources available to your application, is connected to your application. When you connect the nucleus, you can create resources, such as workstations, structure stores, and font directories for use by your application. You can connect several application processes to the nucleus. Using the attach subroutines, several application processes share resources. Using message subroutines, application processes communicate with each other. In addition, your application can control the timing of when the graPHIGS API sends buffered transactions to the nucleus for processing.

Also invoke these subroutines to affect the timing of update operations and to explicitly control the update and redraw operations on a workstation.

These subroutines do not store or modify graphics data.

GPATR - Attach Resource

GPATR (*type*, *id*, *ncid*, *rid*, *pass*)

Purpose

Use **GPATR** to allow your application the use of resources created by other application processes that are connected to the specified nucleus. Use this subroutine when several application processes in different nodes (such as a host application and a Distributed Application Process [DAP]) share access and control of the same resource (such as a workstation or structure store).

The *id* parameter specifies an identifier to be assigned by your application to the attached resource. For example, if the *type* parameter specifies 1=WORKSTATION, then the application uses the specified *id* as the workstation identifier (*wsid*) of the attached workstation. Similarly, for the other resource types, the *id* parameter is used as the structure store identifier (*ssid*), image board identifier (*ibid*), font directory identifier (*fdid*), or archive file identifier (*arid*) respectively.

The *rid* parameter is obtained by the application process that created the resource by issuing the Inquire Nucleus Resource Identifier (**GPQNCR**) subroutine. It is the resource identifier assigned by the nucleus to the resource when it was created. The application process must then provide the assigned identifier (*rid*) and any required password (*pass*) to your application process for use by this subroutine.

If the specified resource type is 1=WORKSTATION, then the current workstation state is set to Workstation Open (WSOP).

If the specified resource type is 2=STRUCTURE_STORE, then the current structure state is set to Structure Store Open (SSOP). After attaching to the specified structure store, your application must issue the Select Structure Store (**GPSSS**) subroutine before any editing of the structure store is allowed.

If the specified resource type is 5=ARCHIVE_FILE, then the current archive state is set to Archive Open (AROP).

Parameters

5

type — **specified by user, fullword integer**
Resource type (1=WORKSTATION, 2=STRUCTURE_STORE, 3=IMAGE_BOARD, 4=FONT_DIRECTORY, 5=ARCHIVE_FILE).

id — **specified by user, fullword integer**
Identifier to be assigned to the resource.

ncid — **specified by user, fullword integer**
Nucleus identifier.

rid — **specified by user, fullword integer**
Nucleus resource identifier.

pass — **specified by user, fullword integer**
Resource password.

Error Codes

24	SPECIFIED WORKSTATION IDENTIFIER ALREADY IS IN USE
202	SPECIFIED NUCLEUS DOES NOT EXIST
211	RESOURCE TYPE IS INVALID
212	SPECIFIED RESOURCE IDENTIFIER DOES NOT EXIST
213	SPECIFIED PASSWORD IS INCORRECT
219	SPECIFIED ARCHIVE FILE IDENTIFIER ALREADY IN USE
221	SPECIFIED STRUCTURE STORE IDENTIFIER ALREADY IS IN USE
231	SPECIFIED IMAGE BOARD IDENTIFIER ALREADY IS IN USE
241	SPECIFIED FONT DIRECTORY IDENTIFIER ALREADY IS IN USE

Related Subroutines

GPCRFD	Create Font Directory
GPCRIB	Create Image Board
GPCRSS	Create Structure Store
GPCRWS	Create Workstation
GPDTR	Detach Resource
GPOPAR	Open Archive File
GPQATR	Inquire List of Attached Resources
GPQNCR	Inquire Nucleus Resource Identifier
GPSSS	Select Structure Store

RCP code

201341697 (X'0C003B01')

GPCLAR - Close Archive File

GPCLAR (*arid*)

Purpose

Use **GPCLAR** to close the specified open graPHIGS API archive file.

If no other archive files are open, then **GPCLAR** sets the current archive state to Archive Closed (ARCL).

Parameters

arid — **specified by user, fullword integer**
     Archive file identifier.

Error Codes

7	FUNCTION REQUIRES STATE AROP
220	SPECIFIED ARCHIVE FILE DOES NOT EXIST

Related Subroutines

GPOPAR	Open Archive File

RCP code

201348356 (X'0C005504')

GPCLPH - Close graPHIGS

GPCLPH

Purpose

Use **GPCLPH** to terminate all graPHIGS API processing for this application process. This subroutine function detaches all attached resources or resources created by the application and disconnects all nuclei connected to the application. **GPCLPH** closes all graPHIGS API files and releases system resources, such as storage and locks. This subroutine also sets the graPHIGS system state to graPHIGS Closed (PHCL). Reopen the graPHIGS API by invoking the Open graPHIGS (**GPOPPH**) subroutine.

Error Codes

None

Related Subroutines

GPOPPH	Open graPHIGS

RCP code

201327105 (X'0C000201')

GPCLWS - Close Workstation

GPCLWS (*wsid*)

Purpose

Use **GPCLWS** to close the specified workstation. The workstation updates automatically before closing.

This subroutine function releases the workstation state list and deletes the workstation's identifier from the set of opened workstations in the graPHIGS API state list. Additionally, **GPCLWS** flushes the input queue of all events from all input devices on the workstation, and releases the connection to the workstation. If no workstation remains open, the workstation state is set to Workstation Closed (WSCL).

GPCLWS clears the workstation. For workstations that keep a local copy of the structure store, the graPHIGS API frees the structure storage at this time.

This subroutine is functionally equivalent to the Detach Resource (**GPDTR**) subroutine with a resource type set to `1=WORKSTATION`.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

Error Codes

25	SPECIFIED WORKSTATION DOES NOT EXIST
147	EVENT QUEUE HAS OVERFLOWED

Related Subroutines

GPCRWS	Create Workstation
GPDTR	Detach Resource
GPOPWS	Open Workstation
GPQOPW	Inquire Set of Open Workstations

RCP code

201327617 (X'0C000401')

GPCNC - Connect Nucleus

GPCNC (*ncid*, *conn*, *len*, *spec*)

Purpose

Use **GPCNC** to establish access to a nucleus from your application. The nucleus allows your application to access resources, such as a workstation and a structure store, for graphics processing.

This subroutine must be invoked in order to communicate with a nucleus. Your application may choose to invoke this subroutine or have the graPHIGS API invoke this subroutine for your application as part of *nucleus connection processing*.

When the graPHIGS API performs *nucleus connection processing*, it connects to a nucleus (**GPCNC**) with an identifier set to a value of one, creates a structure store (**GPCRSS**) with an identifier set to a value of one, and selects that structure store (**GPSSS**) for editing. This may be done as follows:

- If your application is using any workstation *except* the 6090 workstation and you want the graPHIGS API to invoke this subroutine for your application as part of *nucleus connection processing*, then you do *not* need to do anything additional. When your application executes an Open graPHIGS (**GPOPPH**) subroutine, the application connects to a nucleus with an identifier set to a value of one, using the `1=CALL` connection method.

- If your application is using the 6090 workstation and you want the graPHIGS API to invoke this subroutine for your application as part of *nucleus connection processing*, then you *must* use the Define Nucleus Connection Processing (DEFNUC) procopt default in either the Application Defaults Interface Block (ADIB) or the External Default File (EDF) to indicate this.

- If you want your application to invoke this subroutine explicitly, then you must use the Define Nucleus Connection Processing (DEFNUC) procopt default in either the Application Defaults Interface Block (ADIB) or the External Defaults File (EDF) to suppress the graPHIGS API from invoking the connect to nucleus as part of *nucleus connection processing*. (If your application is a distributed application process [DAP], then it is *not* necessary to suppress *nucleus connection processing*.

For information about nucleus connection, see *The graPHIGS Programming Interface: Understanding Concepts*.

For the available nucleus connection methods, connection specifications, and information concerning Application Defaults Interface Block (ADIB) and External Defaults File (EDF), see *The graPHIGS Programming Interface: Technical Reference*.

Parameters

ncid — **specified by user, fullword integer**
    Nucleus identifier.

conn — **specified by user, fullword integer**
    Connection method (1=CALL, 2=GAM, 3=SOCKETS) GAM stands for *Graphics Access Method* and is the connection method used with the IBM 6090 Graphics System Access.

    The connection methods that are supported for each combination of nucleus and application environments are summarized in the following table:

Figure 1. Nucleus/Application Environment

```
                            Application Environment

                    VM        MVS       AIX        6090
                 -----------------------------------------
                 |       |       |       |            |

GPCRFD - Create Font Directory

GPCRFD (*fdid*, *ncid*, *fdtype*, *fddesc*)

Purpose

Use **GPCRFD** to create a font directory and attach it to your application. A font directory allows your application to send geometric text font files to a nucleus. The graPHIGS API uses these files to display

geometric text on a workstation. (To accomplish this, your application must also associate the font directory to the workstation and activate the font on the workstation.)

This subroutine is not required unless your application needs to replace the font files of the nucleus. By default, a workstation has access to the font files that reside on the nucleus. When overriding a nucleus font file, your application creates a font directory to store the font file that is to be loaded from your application's set of fonts. (For more information about fonts, see *The graPHIGS Programming Interface: Understanding Concepts (POWER-based System Only)*.)

Parameters

fdid **— specified by user, fullword integer**
      Font directory identifier.

ncid **— specified by user, fullword integer**
      Nucleus identifier.

fdtype **— specified by user, fullword integer**
      Font directory type (`1=NORMAL`).

fddesc **— specified by user, variable data**
      Font directory descriptor. This parameter includes font directory type dependent data. For the font directory type set to `1=NORMAL`, no descriptive data is required; therefore, this parameter must be specified with a value of zero.

Error Codes

202	SPECIFIED NUCLEUS DOES NOT EXIST
217	RESOURCE CREATION REQUEST EXCEEDS NUCLEUS TABLE CAPACITY
241	SPECIFIED FONT DIRECTORY IDENTIFIER ALREADY IS IN USE
243	SPECIFIED FONT DIRECTORY TYPE IS NOT SUPPORTED

201341185 (X'0C003901')

GPCRIB - Create Image Board

GPCRIB (*ibid*, *ncid*, *depth*, *h*, *v*, *ibtype*, *ibdesc*)

Purpose

Use **GPCRIB** to create an image board and attach it to your application. An image board is a two-dimensional array of data values that your application can manipulate to create an image that your

workstation can display. For information about image support, see *The graPHIGS Programming Interface: Understanding Concepts (POWER-based System Only)*.

Parameters

ibid **— specified by user, fullword integer**
> Image board identifier.

ncid **— specified by user, fullword integer**
> Nucleus identifier.

depth **— specified by user, fullword integer**
> Bit depth (`1`, `2`, `4`, `8`, `12`).

h **— specified by user, fullword integer**
> Horizontal size (>=1).

v **— specified by user, fullword integer**
> Vertical size (>=1).

ibtype **— specified by user, fullword integer**
> Image board type (`1=NORMAL`).

ibdesc **— specified by user, variable data**
> Image board descriptor. This parameter includes image board type dependent data. For the image board type set to `1=NORMAL`, no descriptive data is required; therefore, this parameter must be set to a value of zero.

Error Codes

202	SPECIFIED NUCLEUS DOES NOT EXIST
217	RESOURCE CREATION REQUEST EXCEEDS NUCLEUS TABLE CAPACITY
231	SPECIFIED IMAGE BOARD IDENTIFIER ALREADY IS IN USE
233	SPECIFIED IMAGE BOARD BIT DEPTH IS NOT SUPPORTED
234	SPECIFIED IMAGE BOARD SIZE IS INVALID
235	SPECIFIED IMAGE BOARD TYPE IS NOT SUPPORTED
1109	FUNCTION NOT SUPPORTED

RCP code

201342977 (X'0C004001')

GPCRSS - Create Structure Store

GPCRSS (*ssid*, *ncid*, *sstype*, *ssdesc*)

Purpose

Use **GPCRSS** to create a structure store and attach it to your application.

If the current structure state is Structure Store Close (SSCL), it is set to Structure Store Open (SSOP).

A structure store is required if your application is to display graphical data on a workstation using output primitives and their attributes.

Before any editing of a structure is allowed, the application must select a structure store by issuing the Select Structure Store (**GPSSS**) subroutine. Before displaying any structure data on a workstation, the application must associate the structure store to the workstation by issuing the Associate Structure Store with Workstation (**GPASSW**) subroutine. For compatibility with previous releases, this subroutine, along with the Select Structure Store (**GPSSS**) subroutine, is called automatically during Open graPHIGS (**GPOPPH**) processing unless otherwise suppressed. If you suppress the default nucleus connection processing by using the Define Nucleus Connection Processing (DEFNUC) procopt default in either the Application Defaults Interface Block (ADIB) or the External Defaults File (EDF), then you must invoke this subroutine prior to opening a structure.

For information about structure stores, see *The graPHIGS Programming Interface: Understanding Concepts (POWER-based System Only)*.

Parameters

ssid — **specified by user, fullword integer**
Structure store identifier.

ncid — **specified by user, fullword integer**
Nucleus identifier.

sstype — **specified by user, fullword integer**
Structure store type (1=NORMAL).

ssdesc — **specified by user, variable data**
Structure store descriptor. This parameter includes structure store type dependent data. For the structure store type 1=NORMAL, no descriptive data is required and so this parameter must be specified as a zero.

Error Codes

202	SPECIFIED NUCLEUS DOES NOT EXIST
217	RESOURCE CREATION REQUEST EXCEEDS NUCLEUS TABLE CAPACITY
221	SPECIFIED STRUCTURE STORE IDENTIFIER ALREADY IS IN USE
223	SPECIFIED STRUCTURE STORE TYPE IS NOT SUPPORTED

Related Subroutines

GPASSW	Associate Structure Store with Workstation

GPQSTV	Inquire Structure State Value
GPSSS	Select Structure Store

201340929 (X'0C003801')

GPCRWS - Create Workstation

GPCRWS (*wsid*, *ncid*, *length*, *connid*, *wstype*, *option*)

Purpose

Use **GPCRWS** to open the specified workstation on the specified nucleus and optionally to provide default values to be used by the workstation during its initialization. The current workstation state is set to Workstation Open (WSOP).

The *option* parameter enables your application to modify the workstation's defaults by specifying a group of procopts. These specified procopts override the procopts available in the Application Defaults Interface Block (ADIB) or the External Defaults File (EDF). (For information about valid procopts and their values, see *The graPHIGS Programming Interface: Technical Reference (POWER-based System Only)*.

When no procopts are specified, a fullword integer with a value of zero must be specified for the parameter.

This subroutine does *not* automatically associate the currently selected structure store with a workstation. In order for association to occur, the application must explicitly issue the Associate Structure Store with Workstation (**GPASSW**) subroutine.

This subroutine is functionally equivalent to the Open Workstation (**GPOPWS**) subroutine with nucleus identifier of one with the exception that **GPCRWS** will *not* perform the implicit Associate Structure Store with Workstation (**GPASSW**) processing.

Parameters

wsid — **specified by user, fullword integer**
    Workstation identifier.

ncid — **specified by user, fullword integer**
    Nucleus identifier.

length — **specified by user, fullword integer**
    Length of the connection identifier (>0).

connid — **specified by user, variable length character string**
    Connection identifier indicates the physical device to be opened. (For information about the connection identifier, see *The graPHIGS Programming Interface: Technical Reference (POWER-based System Only)*.

wstype — **specified by user, 8-byte character string**
    One of the graPHIGS API supported workstation types. (For information about the supported workstation types, see *The graPHIGS Programming Interface: Technical Reference (POWER-based System Only)*.

option — **specified by user, variable data**
    Workstation creation option.

    The *option* parameter has the following format:

```
    --------------------------
   |  total length of data   |   Fullword integer
   |-----------------------|
```
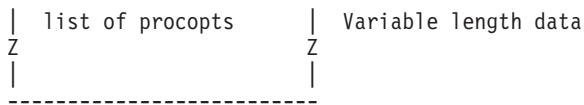

```
           |  list of procopts      |  Variable length data
           Z                        Z
           |                        |
           --------------------------
```

For information about valid procopts and their values, see *The graPHIGS Programming Interface: Technical Reference*. When no option is specified, a fullword integer with a value zero must be specified for the parameter.

GPDF - Set Deferral State

> GPDF (*wsid*, *defer*, *modif*)

Purpose

Use**GPDF** to set the deferral state and modification mode for the specified workstation.

These settings determine when pending updates are processed for display on a workstation and how the workstation is to perform the modifications. For information about the abbreviations and modes, see *The graPHIGS Programming Interface: Understanding Concepts*.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

defer — **specified by user, fullword integer**
Deferral state (1=ASAP, 2=BNIG, 3=BNIL, 4=ASTI, 5=WAIT).

modif — **specified by user, fullword integer**
Modification mode (1=NO_IMMEDIATE_VISUAL_EFFECT, 2=UPDATE_WITHOUT_REGENERATION, 3=QUICK_UPDATE).

GPDNC - Disconnect Nucleus

GPDNC (*ncid*)

Purpose

Use **GPDNC** to disconnect a graPHIGS nucleus from your application. All of the resources of the nucleus become unavailable to your application.

The following actions are performed:

1. If the structure state is Structure Open (STOP) and the currently selected structure store is a resource of the specified nucleus, the structure is closed. As a result, the structure state becomes Structure Close (STCL).

2. If the structure state is Structure Close (STCL) and the currently selected structure store is a resource of the specified nucleus, the structure store identifier is removed from the currently selected structure store entry of the graPHIGS API state list. As a result, the structure state becomes Structure Store Open (SSOP).

3. All resources of the specified nucleus are detached from the shell. If there remains no structure store or no workstation attached to the shell, the structure state or workstation state becomes Structure Store Close (SSCL) or Workstation Close (WSCL), respectively.

Parameters

ncid — **specified by user, fullword integer**
Nucleus identifier.

Error Codes

202	SPECIFIED NUCLEUS DOES NOT EXIST

GPDTR - Detach Resource

GPDTR (*type*, *id*)

Purpose

Use **GPDTR** to detach a resource from your application. The resource becomes unavailable to your application.

The *id* parameter specifies an identifier that your application assigned to the resource. The *type* parameter is used to identify the type of resource that is specified by the *id* parameter. For example, if the *type* parameter specifies `1=WORKSTATION`, then the *id* parameter is used to specify a workstation identifier (*wsid*) to be detached.

If the specified resource type is `1=WORKSTATION`, all events from the specified workstation are removed from the event queue. If the specified workstation is the last open workstation, the workstation state value is set to Workstation Closed (WSCL)

If the specified resource type is `2=STRUCTURE_STORE`, all events from the specified structure store are removed from the event queue. If the current structure state is Structure Open (STOP) and the specified structure store is currently selected, then the current open structure is closed. As a result, the structure state is set to Structure Closed (STCL). If the current structure state is Structure Closed (STCL) and the specified structure store is the currently selected structure store, it is removed from the currently selected structure store entry of the graPHIGS API state list. As a result, the structure state is set to Structure Store Open (SSOP). If the specified structure store is the last structure store attached to the shell, then the structure state is set to Structure Store Closed (SSCL).

If the specified resource type is `5=ARCHIVE_FILE` and if the specified archive file is the last open archive file, then the archive state value is set to Archive Closed (ARCL).

Parameters

type — **specified by user, fullword integer**
> Resource type (1=WORKSTATION, 2=STRUCTURE_STORE, 3=IMAGE_BOARD, 4=FONT_DIRECTORY, 5=ARCHIVE_FILE).

id — **specified by user, fullword integer**
> Identifier of the resource to be detached.

GPMSG - Message

GPMSG (*wsid*, *length*, *text*)

Purpose

Use **GPMSG** to display a message on the specified workstation.

The message text appears in the lower left corner of the workstation viewport and is clipped to this viewport.

The message is unaffected by deferral state settings and remains displayed until removed by another message. It can be cleared by calling **GPMSG** with a length of zero.

The appearance (size and color) of the message text is workstation dependent. The workstation's primary character set is used to convert the text if necessary.

For workstation-specific information about message text, see information about character sets in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

wsid — **specified by user, fullword integer**
    Workstation identifier.

length — **specified by user, fullword integer**
    Length of text to be displayed (>=0).

text — **specified by user, variable length character string**
    Message to be displayed.

Error Codes

25   SPECIFIED WORKSTATION DOES NOT EXIST

197   MESSAGE STRING LENGTH < ZERO

Related Subroutines

None

RCP code

201327876 (X'0C000504')

GPMSPW - Set Message Password

GPMSPW (*ncid*, *pass*)

Purpose

Use **GPMSPW** to set a password for application message receiving. The graPHIGS API uses this password to authorize the Send Private Message (**GPSPMS**) subroutine or Send Broadcast Message (**GPSBMS**) subroutine issued by other application processes.

For more information about the use of broadcast and private messages, see *The graPHIGS Programming Interface: Understanding Concepts* and *The graPHIGS Programming Interface: Writing Applications*.

Parameters

ncid — **specified by user, fullword integer**
    Nucleus identifier.

pass — **specified by user, fullword integer**
    Password.

> **0=None**
>   Application will not receive messages.
>
> **-1=All**   Application will receive any broadcast or private messages.
>
> **Unique Integer**
>   Application will receive only private messages.

GPOPAR - Open Archive File

GPOPAR (*arid*, *ncid*, *flag*, *length*, *ardesc*)

Purpose

Use **GPOPAR** to open and initialize a graPHIGS API archive file.

This subroutine function sets the current archive state to Archive Open (AROP).

If the specified archive file exists as read only and the application attempts to open the file as `1=OPEN_READ/WRITE`, then the graPHIGS API opens the file and issues the warning message 1113. If it cannot open the file, then the graPHIGS API issues an error.

If the specified archive file does not exist and the archive flag is set to a value of `1=OPEN_READ/WRITE`, then the archive file resource creates a new read/write file. If the specified archive file does not exist and the archive flag is set to a value of `2=OPEN_READ_ONLY`, then the graPHIGS API issues an error.

The graPHIGS API External Defaults File (EDF) allows the application to denote, indirectly, the actual value of the file descriptor. For more information on the contents and formats of the EDF, see *The graPHIGS Programming Interface: Technical Reference* under "Defaults and Nicknames."

Parameters

arid — **specified by user, fullword integer**
    Archive file identifier.

ncid — **specified by user, fullword integer**
>   Nucleus identifier.

flag — **specified by user, fullword integer**
>   Archive flag (1=OPEN_READ/WRITE, 2=OPEN_READ_ONLY.)

length — **specified by user, fullword integer**
>   Length of the file descriptor (>=1).

ardesc — **specified by user, variable length character string**
>   Archive file descriptor. This parameter looks like a Unix file descriptor which consists of a **[path]/filename[extension]**. **Path** is the route of directories through the file system. **Path** is optional and ignored for MVS and VM. An example of a full file descriptor:
>
>   `/phigs/file1.archive`
>
>   where:
>   - **path** = **/phigs** which says go from the root directory to the directory **phigs**
>   - **filename** = **file1**
>   - **extension** = **.archive**
>
>   The following rules apply to the descriptor, depending on which system the nucleus is running in:
>   - **AIX**
>
>   If you do not specify the path, then the graPHIGS API uses the default directory at the time of the execution of the subroutine.
>   - **MVS**
>   - `filename` - You must specify a filename. This is the DD-name of the BSAM data set of the archive file.
>   - `extension` - Any extension is ignored.
>   - **VM/CMS**
>
>   The file descriptor can have one of two forms:
>   - `filename [filetype [filemode]]` or
>   - `filename[.filetype[.filemode]]`
>
>   If the filetype is missing, then the graPHIGS API uses a filetype of `ARCHIVE`.
>
>   If the filemode is missing, then the graPHIGS API uses a filemode of `A1`

GPOPPH - Open graPHIGS

GPOPPH (*errfil*, *adib*)

Purpose

Use **GPOPPH** to open and initialize the graPHIGS API. This subroutine makes all the graPHIGS API subroutines available. Call **GPOPPH** before invoking any other graPHIGS API subroutine.

This subroutine creates one graPHIGS API shell and initializes the graPHIGS API state list (PSL) **GPOPPH** sets the system state value to graPHIGS Open (PHOP), sets the workstation state value to Workstation Closed (WSCL), and sets the structure state value to Structure Closed (STCL).

The Application Defaults Interface Block (ADIB) allows the application to modify the graPHIGS API system and workstation defaults. For the contents and formats of the Application Defaults Interface Block (ADIB) and the External Defaults File (EDF), see *The graPHIGS Programming Interface: Technical Reference* under "Defaults and Nicknames."

In this version of the graPHIGS API, some additional subroutines must be issued in order to communicate with a nucleus and to edit structures. These subroutines consist of:

- Connect to Nucleus (**GPCNC**)
- Create Structure Store (**GPCRSS**)
- Select Structure Store (**GPSSS**)

Your application may chose to issue these additional subroutines or have the graPHIGS API issue these subroutines for your application (which is called *nucleus connection processing*). Nucleus connection processing may be done as follows:

- If your application is using any workstation except the 6090 workstation and you want the graPHIGS API to invoke nucleus connection processing for your application, then you do *not* need to do anything additional. When you execute your application, it connects to a nucleus with the identifier set to a value of one, and the graPHIGS API creates and selects a structure store with the identifier set to a value of one for your application.

- If your application is going to use the 6090 workstation and you want the graPHIGS API to invoke nucleus connection processing, then you *must* use the Default Nucleus Connection Processing (DEFNUC) procopt default in either the Application Defaults Interface Block (ADIB) or the External Defaults File (EDF) to indicate this.

- If your application is going to issue these additional subroutines, then you *must* use the Default Nucleus Connection (DEFNUC) procopt in the Application Defaults Interface Block (ADIB) or the External

Defaults File (EDF) to suppress the graPHIGS API from invoking nucleus connection processing. (It is *not* necessary to suppress nucleus connection processing if your application is a distributed application process [DAP]).

To determine if the **GPOPPH** subroutine call was successful, your application can use the Inquire System State Value (**GPQSYV**) subroutine.

For formats and contents of the Application Defaults Interface Block (ADIB) and External Defaults File (EDF), see *The graPHIGS Programming Interface: Technical Reference* under ″Defaults and Nicknames.″

Parameters

errfil — **specified by user, 8-byte character string**
    Name of the error file.

adib — **specified by user, variable data**
    Application Defaults Interface Block (ADIB). When no defaults are specified, an ADIB that consists of a fullword integer with a value of zero must be specified.

GPOPWS - Open Workstation

GPOPWS (*wsid*, *connid*, *wstype*)

Purpose

Use **GPOPWS** to open the specified workstation on a nucleus with the identifier set to a value of one.

If a structure store is currently selected (structure state is Structure Close (STCL) or Structure Open (STOP)), the graPHIGS API calls the Associated Structure Store with Workstation (**GPASSW**) subroutine to associate the currently selected structure store with the specified workstation. This implicit association, along with the implicit processing during Open graPHIGS (**GPOPPH**), allows the graPHIGS API to create the correct processing environment for applications unchanged from Version 1.

GPOPWS uses a nucleus identifier set to a value of one to create the specified workstation. If the nucleus identifier of value one does not exist, then the graPHIGS API issues error 202. If you wish to use a nucleus identifier other than value one, then you must use the Create Workstation (**GPCRWS**) subroutine.

If a connection identifier longer than eight characters is required, then you must either issue the Create Workstation (**GPCRWS**) subroutine or you must define a nickname in the Application Defaults Interface Block (ADIB) or the External Defaults File (EDF).

This subroutine is functionally equivalent to the Create Workstation (**GPCRWS**) subroutine with a nucleus identifier set to a value of one,with the exception that **GPOPWS** performs the implicit Associate Structure Store with Workstation (**GPASSW**) processing.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

connid — **specified by user, 8-byte character string**
Connection identifier indicates the physical device to be opened.

wstype — **specified by user, 8-byte character string**
One of the graPHIGS API supported workstation types.

GPPW - Set Password

GPPW (*type*, *id*, *pass*)

Purpose

Use **GPPW** to assign a password to a resource. The graPHIGS API uses this password to validate the Attach Resource (**GPATR**) request from other application processes.

The *id* parameter specifies an identifier that your application assigned to the resource. The graPHIGS API uses the *type* parameter to identify the type of resource that the *id* parameter specifies. For example, if the *type* parameter specifies 1=WORKSTATION, then the graPHIGS API uses the *id* parameter to specify a workstation identifier (*wsid*) whose password is set.

Your application must provide this password (as well as the nucleus's resource identifier for the resource) to other applications that you authorize to access the resource. Use the Send Private Message (**GPSPMS**) subroutine to send this information. The Attach Resource (**GPATR**) subroutine then uses this information to authorize access to the resource.

For more information about the use of resource passwords and application messages, see *The graPHIGS Programming Interface: Understanding Concepts*.

Parameters

type — **specified by user, fullword integer**
Resource type (1=WORKSTATION, 2=STRUCTURE_STORE, 3=IMAGE_BOARD, 4=FONT_DIRECTORY, 5=ARCHIVE_FILE).

id — **specified by user, fullword integer**
An identifier of the resource.

pass — **specified by user, fullword integer**
Password.

0=None
Only the application that created the resource can access the resource.

-1=All Any application can access the resource.

Unique Integer
Only applications that supply the password can access the resource.

Error Codes

GPRAST - Redraw All Structures

GPRAST (*wsid*, *flag*)

Purpose

Use **GPRAST** to redraw all structures on the specified workstation.

When your application invokes this subroutine, the graPHIGS API executes the actions in the sequence outlined below:

1. The graPHIGS API executes all deferred actions for the specified workstation without an intermediate clearing of the display surface.

2. If the control flag is set to `1=CONDITIONALLY`, then the graPHIGS API clears the display surface only if the Display Surface Empty entry in the WSL is `1=NOT_EMPTY` If the control flag is set to `2=ALWAYS`, then the graPHIGS API clears the display surface regardless of the setting of the Display Surface Empty entry. At the conclusion of this step, the graPHIGS API sets the entry to `2=IS_EMPTY`.

3. If the workstation window, viewport, view matrix, view mapping, or view characteristics have changed for any view, then the graPHIGS API assigns the current entries in the Workstation State List (WSL) to the corresponding values from the requested entries. The Transformation Update State is set to `1=NOT_PENDING` and the transformation view matrix, view mapping, and view characteristics change flags are set to `NOTCHANGED`.

4. Finally, the graPHIGS API retraverses all structures associated with views for this workstation. If the set of structures associated with this workstation's views are not empty, retraversal usually sets the Display Surface Empty entry in the WSL to `1=NOT_EMPTY`.

Parameters

wsid **— specified by user, fullword integer**
Workstation identifier.

flag — **specified by user, fullword integer**
    Control flag (`1=CONDITIONALLY, 2=ALWAYS`).

Error Codes

25   SPECIFIED WORKSTATION DOES NOT EXIST

35   WORKSTATION HAS ONLY INPUT CAPABILITIES

GPSBMS - Send Broadcast Message

GPSBMS (*ncid*, *major*, *minor*, *len*, *msg*)

Purpose

Use **GPSBMS** to send a broadcast message to all application processes that can accept messages and are connected to the specified nucleus. To be able to accept messages, you previously must have set the application's message password to `-1=ALL`. For information about sending and receiving messages between application processes, see *The graPHIGS Programming Interface: Understanding Concepts*.

Parameters

ncid — **specified by user, fullword integer**
    Nucleus identifier.

major — **specified by user, fullword integer**
    Major code.

minor — **specified by user, fullword integer**
    Minor code.

len — **specified by user, fullword integer**
    Length of the message in bytes (>=0).

msg — **specified by user, variable data**
    Message.

GPSDAL - Sound Alarm

GPSDAL (*wsid*)

Purpose

Use **GPSDAL** to sound the alarm (bell, buzzer, etc.) at the specified workstation. If an alarm is not present, or the workstation does not support this subroutine, then the subroutine is ignored.

Parameters

wsid — **specified by user, fullword integer**
   Workstation identifier.

Error Codes

25   SPECIFIED WORKSTATION DOES NOT EXIST

Related Subroutines

GPQES
   Inquire List of Available Escape Subroutines

RCP code

201327877 (X'0C000505')

GPSHDF - Set Shell Deferral State

GPSHDF (*deferral*, *update*)

Purpose

Use **GPSHDF** to set the shell deferral mode and the update notification mode.

A shell deferral mode set to 2=DEFERRED controls whether the following workstation control subroutines cause the graPHIGS API to send buffered requests to the nucleus which contains the workstation:

- Set Deferral State (**GPDF**)
- Redraw All Structures (**GPRAST**)
- Update Workstation (**GPUPWS**)
- Update Workstation Asynchronous (**GPUPWA**)

A shell deferral mode set to `3=DEFERRED_PLUS_MSGS` controls whether the following subroutines cause the graPHIGS API to send buffered requests to the nucleus:

* Set Deferral State (**GPDF**)
* Redraw All Structures (**GPRAST**)
* Update Workstation (**GPUPWS**)
* Update Workstation Asynchronous (**GPUPWA**)
* Send Private Message (**GPSBMS**)
* Send Broadcast Message(**GPSPMS**)

When the shell deferral mode is set to `1=FLUSH` (default), each of the above subroutines results in sending buffered API requests to the nucleus. When the shell deferral mode is set to `2=DEFERRED` or `3=DEFERRED_PLUS_MSGS`, the graPHIGS API suppresses this automatic initiation for the specified subroutines. The application can use the Synchronize (**GPSYNC**) subroutine explicitly to send a buffered request to the nucleus. However, there are other graPHIGS API subroutines that the application has no control over that implicitly cause the API buffered requests to be sent to the nucleus. For information about buffered requests being sent to the nucleus, see *The graPHIGS Programming Interface: Understanding Concepts*.

The update notification mode controls whether or not the graPHIGS API notifies the application about the completion of an update process initiated by the Redraw All Structures (**GPRAST**) or the Update Workstation (**GPUPWS**) subroutine.

When the update notification mode is set to `1=NO` (default), the graPHIGS API does not notify the application when the graPHIGS API completes the update process. The nucleus ensures that the update process is completed without any intermediate interruption but the application cannot know when it has completed. When the update notification mode is `2=YES`, the application is asynchronously notified by an Update Completion Event that the graPHIGS API completed the update process. For information about Update Completion Events, see *The graPHIGS Programming Interface: Technical Reference*.

> **Note:** The Update Completion Event is generated even for the Update Workstation subroutine with regeneration flag `1=POSTPONE`. In this case, the event is generated immediately after the Update Workstation request is processed by the nucleus and it may contain a display status of `2=DEFERRED`.

Parameters

deferral **— specified by user, fullword integer**
Shell deferral mode (`1=FLUSH, 2=DEFERRED, 3 DEFERRED_PLUS_MSGS`).

update **— specified by user, fullword integer**
Update notification mode (`1=NO, 2=YES`).

GPSPMS - Send Private Message

GPSPMS (*ncid*, *shid*, *pass*, *major*, *minor*, *len*, *msg*)

Purpose

Use **GPSPMS** to send an application message to another application process connected to the specified nucleus. To be able to send private messages, you previously must have set the message of the target application process to `-1=ALL` or set a unique password that matches the password supplied in the *pass* parameter. The message is limited to the size of the outbound buffer of the sending application and the size of the inbound buffer and event queue of the target application.

For information about sending and receiving messages between application processes, see *The graPHIGS Programming Interface: Understanding Concepts*.

Parameters

ncid — **specified by user, fullword integer**
>Nucleus identifier.

shid — **specified by user, fullword integer**
>Target application identifier.

pass — **specified by user, fullword integer**
>Password. This must match the password of the target application process.

GPSYNC - Synchronize

GPSYNC (*ncid*, *synch*)

Purpose

Use **GPSYNC** to send buffered requests to the specified nucleus.

When the synchronization mode (*synch*) parameter is set to `1=NOWAIT`, the graPHIGS API sends the buffer to the nucleus and returns control to the application before the nucleus processes the buffer.

When the synchronization mode (*synch*) parameter is set to `2=SYNC_WAIT`, the graPHIGS API does not return control to the application until the nucleus processes all requests and the graPHIGS API has reported any errors.

While debugging your application, you may wish to send each buffered request after every graPHIGS API subroutine call so that errors detected by the nucleus can be processed immediately. This synchronization can be accomplished through a second-level error exit defined using the Specify Error Exit and Error Threshold (**GPEXIT**) subroutine. With the error severity threshold set to a value of zero, your application defined error exit will receive control after every graPHIGS API subroutine call (except the **GPEXIT** subroutine) Therefore, a call to **GPSYNC** from a second-level error exit sends all buffered requests before the graPHIGS API returns control to your application.

This technique will degrade the performance of your application and is only recommended for debugging purposes. For information about second-level error handlers and error severities, see *The graPHIGS Programming Interface: Understanding Concepts*.

Preventing second-level error exits from causing infinite loops is discussed under the Specify an Error Exit and Error Threshold (**GPEXIT**) subroutine.

Parameters

ncid — **specified by user, fullword integer**
  Nucleus identifier.

synch — **specified by user, fullword integer**
  Synchronization mode (`1=NOWAIT`, `2=SYNC_WAIT`).

Error Codes

202   SPECIFIED NUCLEUS DOES NOT EXIST

GPTRCE - Internal Trace Control

> **GPTRCE (*control*)**

Purpose

Use **GPTRCE** to control the tracing facilities of the graPHIGS API.

The tracing information may be helpful in the diagnosis of problems and may be requested by IBM for the diagnosis of reported problems.

By default, trace is set to a value of zero (trace is not active).

Parameters

control **— specified by user, fullword integer**
A fullword integer whose contents determine the type of tracing performed. A value of zero deactivates all tracing. For information about this parameter, see *The graPHIGS Programming Interface: Writing Applications*.

Error Codes

None

None

RCP code

201337863 (X'0C002C07')

GPUPWA - Update Workstation Asynchronous

> **GPUPWA (*wsid*)**

Purpose

Use **GPUPWA** to immediately update the specified workstation. The system does not wait for the completion of any retraversal which may be under way before the occurrence of the next transaction with this device.

If the application requires the viewing of each update in separate frames, your application must send the Update Workstation (**GPUPWS**) subroutine call. **GPUPWA** allows the combination of consecutive frames into one retraversal when possible.

Parameters

wsid — **specified by user, fullword integer**
>   Workstation identifier.

Error Codes

25   SPECIFIED WORKSTATION DOES NOT EXIST

35   WORKSTATION HAS ONLY INPUT CAPABILITIES

Related Subroutines

GPSHDF
>   Set Shell Deferral State

RCP code

201327879 (X'0C000507')

GPUPWS - Update Workstation

GPUPWS (*wsid*, *regen*)

Purpose

Use **GPUPWS** to update the specified workstation. If any actions have been deferred or simulated as a result of explicit traversal, the graPHIGS API performs a retraversal to update the display.

This subroutine function executes all deferred actions for the specified workstation without intermediate clearing of the display surface. If the regeneration flag is set to `2=PERFORM` and the New Frame Action Necessary at Update entry in the Workstation State List (WSL) is set to `2=YES`, then the graPHIGS API executes all the actions in the sequence outlined below:

1. If the Display Surface Empty entry in the WSL is `1=NOT_EMPTY`, then the graPHIGS API clears the display surface. At the conclusion to this step (Step 1), the graPHIGS API sets the entry to `2=IS_EMPTY`.

2. If the workstation window, viewport, view matrix, view mapping, or view characteristics have changed for any view, then the graPHIGS API assigns the current entries in the Workstation State List (WSL) to the corresponding values from the requested entries. The Transformation Update State entry is set to `1=NOT_PENDING` and the transformation view matrix, view mapping and view characteristics change flags are set to `NOTCHANGED`.

3. The graPHIGS API re-displays all structures associated with views on this workstation. Usually, this action sets the Display Surface Empty entry in the WSL to `1=NOTEMPTY`. The Transformation Update State entry is set to `1=NOT_PENDING`.

4. The state, New Frame Action Necessary at Update, is set to `1=NO` in the WSL. If the value of the state, New Frame Action Necessary at Update is set to `2=YES` and the regeneration flag is set to `2=PERFORM`, then this subroutine is functionally equivalent to the Redraw All Structures (**GPRAST**) subroutine.

5. If the current state of visual representation is set to `3=SIMULATED` and the modification mode is UQUM (Quick Update Method), then the state of visual representation remains unchanged. In all other cases, the state of visual representation is set to `1=CORRECT`.

Parameters

wsid **— specified by user, fullword integer**
> Workstation identifier.

regen **— specified by user, fullword integer**
> Regeneration flag (`1=POSTPONE`, `2=PERFORM`).
>
> When the regeneration flag is set to `1=POSTPONE`, the device sends the pending update information without forcing a retraversal if possible. This is workstation dependent.
>
> When the regeneration flag is set to `2=PERFORM`, the device sends the pending update information and immediately initiates a retraversal.

Error Codes

25   SPECIFIED WORKSTATION DOES NOT EXIST

35   WORKSTATION HAS ONLY INPUT CAPABILITIES

302   REGENERATION FLAG IS INVALID

Chapter 3. Output Primitives

These subroutines address the specification and creation of output primitives, which are structure elements. Many have both two- and three-dimensional forms and are displayed when the structure elements defining them are encountered during structure traversal. To use primitive subroutines, the structure state must be Structure Open (STOP).

Some output primitive subroutines accept lists of structure element data. These lists often are accompanied by a *width* parameter which allows the application program to easily input an array of structure element data that may contain additional application specific information. When these arrays are accepted as parameters, only the structure element data is stored in the structure.

For all two-dimensional output primitive subroutines, the *z* coordinate is assumed to equal zero by default.

If a specified workstation does not support a requested output primitive, then the graPHIGS API updates only the element number in the graPHIGS API traversal state list.

> **Note:** When an application inserts an element into the open structure following the element pointer, the pointer updates to that element.

GPAN2 - Annotation Text 2

GPAN2 (*point*, *length*, *text*)

Purpose

Use **GPAN2** to insert an Annotation Text 2 structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with an Annotation Text 2 structure element depending on the current edit mode.

This structure element specifies a string of text in two-dimensional Modelling Coordinate (MC) space to be drawn at the specified location in a plane parallel to the view plane.

At the time this structure element is created, the current Text Character Set value in the graPHIGS API State List is bound to this character string.

The size and orientation of annotation text is not affected by rotation and scaling. Only its position changes.

Parameters

point — **specified by user, 2 short floating-point numbers (MC)**
 x and *y* coordinates of the annotation text position.

length — **specified by user, fullword integer**
 Length of the annotation text string in bytes (>=0).

text — **specified by user, variable length character string**
 Text string to be displayed.

GPAN3 - Annotation Text 3

GPAN3 (*point, length, text*)

Purpose

Use **GPAN3** to insert an Annotation Text 3 structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with an Annotation Text 3 structure element depending on the current edit mode.

This structure element specifies a string of text in three-dimensional Modelling Coordinate (MC) space to be drawn at the specified location in a plane parallel to the view plane.

At the time this structure element is created, the current Text Character Set value in the graPHIGS API State List is bound to this character string.

The size and orientation of annotation text is not affected by rotation and scaling. Only its position changes.

Parameters

point — **specified by user, 3 short floating-points numbers (MC)**
      x, *y*, and *z* coordinates of the annotation text position.

length — **specified by user, fullword integer**
      Length of the annotation text string in bytes (>=0).

text — **specified by user, variable length character string**
      Text string to be displayed.

GPANR2 - Annotation Text Relative 2

GPANR2 (*refpt*, *textvec*, *length*, *text*)

Purpose

Use **GPANR2** to insert a two-dimensional Annotation Text Relative 2 structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with an Annotation Text Relative 3 structure element depending on the current edit mode.

When you create this structure element, the current Text Character Set value in the graPHIGS API State List is bound to this character string.

During structure traversal, this element annotates the specified reference point according to the annotation style in the traversal state list. The annotation string is positioned according to *textvec* which defines the origin of a local text coordinate system relative to *refpt* after transformation to NPC. The text plane is always parallel to the *x*, *y* plane (*z*=transformed location) in NPC. If the resulting text position is outside the usable NPC space [0,1]x[0,1]x[0,1], then the graPHIGS API may clip part or all of the string.

The application positions and renders the text string in the local coordinate system according to the annotation text attributes in the traversal state list. If the graPHIGS API clips the specified reference point (*refpt*) to NPC during structure traversal, then no representation for this primitive is displayed. If the graPHIGS API does not clip the reference point (*refpt*), then the graPHIGS API clips the displayed representation according to the rules for the corresponding primitive type (e.g., text, polyline, etc.).

If the style (*style*) parameter on the Set Annotation Style (**GPAS**) subroutine is set to 2=LEAD_LINE, then after transformation, the graPHIGS API draws a single line segment from the reference point (*refpt*) to the origin of the local text coordinate system using the polyline attributes in the traversal state list.

Parameters

refpt — **specified by user, 2 short floating-point numbers (MC)**
> *x* and *y* coordinates of the reference location that is to be annotated.

textvec — **specified by user, 2 short floating-point numbers (NPC)**
> *x* and *y* components of a vector which defines the location to position the origin of the local text coordinate system relative to *refpt* after transformation to NPC.

length — **specified by user, fullword integer**
> Length of text string in bytes (>=0).

text — **specified by user, variable length character string**
> Text string to be displayed.

Error Codes

GPANR3 - Annotation Text Relative 3

GPANR3 (*refpt*, *textvec*, *length*, *text*)

Purpose

Use **GPANR3** to insert an Annotation Text Relative 3 structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with an Annotation Text Relative 3 structure element depending on the current edit mode.

When you create this structure element, the current Text Character Set value in the graPHIGS API State List is bound to this character string.

During structure traversal, this element annotates the specified reference point according to the annotation style in the traversal state list. The annotation string is positioned according to *textvec* which defines the origin of a local text coordinate system relative to *refpt* after transformation to NPC. The text plane is always parallel to the *x*, *y* plane in NPC. If the resulting text position is outside the usable NPC space [0,1]x[0,1]x[0,1], then the graPHIGS API may clip part or all of the string.

The application positions and renders the text string in the local coordinate system according to the annotation text attributes in the traversal state list. If the graPHIGS API clips the specified reference point (*refpt*) to NPC during structure traversal, then no representation for this primitive is displayed. If the graPHIGS API does not clip the reference point (*refpt*), then the graPHIGS API clips the displayed representation according to the rules for the corresponding primitive type (e.g., text, polyline, etc.).

If the style (*style*) parameter on the Set Annotation Style (**GPAS**) subroutine is set to 2=LEAD_LINE, then after transformation, the graPHIGS API draws a single line segment from the reference point (*refpt*) to the origin of the local text coordinate system using the polyline attributes in the traversal state list.

Parameters

refpt — **specified by user, 3 short floating-point numbers (MC)**
　　x, *y*, and *z* coordinates of the reference location that is to be annotated.

textvec — **specified by user, 3 short floating-point numbers (NPC)**
　　x, *y*, and *z* components of a vector which defines the location to position the origin of the local text coordinate system relative to *refpt* after transformation to NPC.

length — **specified by user, fullword integer**
　　Length of text string in bytes (>=0).

text — **specified by user, variable length character string**

GPCFA2 - Composite Fill Area 2

GPCFA2 (*ncontour, ncurve, curveinfo, knot, tess, vwidth, vdata*)

Purpose

Use **GPCFA2** to insert a Composite Fill Area 2 structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Composite Fill Area 2 structure element depending on the current edit mode.

During structure traversal, the planar area geometry defined by the specified contours is drawn using the polygon attributes in the traversal state list. Each contour consists of one or more types of curves. The normal on Composite Fill Area 2 is (0,0,1).

When the current edge flag is set to `2=ON` or `3=GEOMETRY_ONLY`, each curve with its boundary flag `ON` is rendered as an edge of the area geometry. You must connect curves within a contour in a head to tail fashion. To ensure that the contour is closed, the graPHIGS API connects each pair of curves by a straight line as is the first point and the last point. The boundary flag for the connecting line segment is determined by the boundary flag of the preceding curve.

Polygon attributes are applied to this primitive.

GPCFA2 is identified as GDP 1027.

Note: Not all GDPs are supported on all workstations. Use the Inquire List of Generalized Drawing Primitives (**GPQGD**) subroutine to determine the GDPs supported by an opened workstation. See also the workstation description in *The graPHIGS Programming Interface: Technical Reference (POWER-based System Only)*.

Parameters

ncontour — **specified by user, fullword integer**
> Number of contours to be generated (>=0).

ncurve — **specified by user, array of fullword integers**
> Number of curves in each contour. Each entry must be greater than or equal to one. The length of this array is defined by the value of the *ncontour* parameter.

curveinfo — **specified by user, array of 6 fullwords of data**
> Array containing information about each curve. Each entry of this parameter must have the following fields in this order. However, for some curve types, one or more fields may be ignored.

> **Type of curve — fullword integer**

> This field must contain one of the following values:

1 -	Line Segments
2 -	Elliptical Arc
3 -	Non-Uniform B-Spline Curve

> **Options — fullword integer**

> This parameter specifies various options for the curve. Each option is specified as a bit in this word. The following bits are currently defined:

Bit	Meaning
0-28	Reserved. Must be set to zero.
29	Tessellation quality flag.
	This option is valid for the Non-Uniform B-Spline Curve only. If set, a tessellation quality value for each span of this curve is specified in the *tess* parameter.
30	Weight flag.
	This option is valid for the Non-Uniform B-Spline Curve only. If set, the curve is rational and the weight is specified for each control point in the *vdata* parameter.
31	Boundary flag.
	If set, the curve is treated as an edge of the composite fill area.

> **Order — fullword integer**

> Order of the curve. For each curve type, this parameter has the following meaning:

1 -	Ignored.
2 -	Ignored.
3 -	Corresponds to the *order* parameter of the Non-Uniform B-Spline Curve 2.

> **Number of vectors — fullword integer**

Number of entries of the *vdata* parameter used to define the curve. This parameter has the following meaning for each curve type:

1 -	Corresponds to the *npoint* parameter of Polyline 2. The specified number's entries of the *vdata* parameter are used as its *pointlist* parameter.
2 -	Must be three. Three entries of the *vdata* parameter are used as the center, first and second reference vectors of the Elliptical Arc 2.
3 -	Corresponds to the *npoint* parameter of the Non-Uniform B-Spline Curve 2. The specified number's entries of the *vdata* parameter are used as its *ctlpts* parameter.

Start — short floating-point number

The parameter value representing the start point of the curve. For each curve type, this parameter has the following meaning:

1 -	Ignored.
2 -	Corresponds to the *startv* parameter of the Elliptical Arc 2.
3 -	Corresponds to the *tmin* parameter of the Non-Uniform B-Spline Curve 2.

End — short floating-point number

The parameter value representing the end point of the curve. For each curve type, this parameter has the following meaning:

1 -	Ignored.
2 -	Corresponds to the *endv* parameter of the Elliptical Arc 2.
3 -	Corresponds to the *tmax* parameter of the Non-Uniform B-Spline Curve 2.

knot — **specified by user, array of short floating-point numbers**
Array of knot values. This array must contain one list for each Non-Uniform B-Spline curve within the *curveinfo* parameter. For other curves, this array is not referenced. The sequence of each list in this array is assumed to match the order of the curve definitions in *curveinfo*. The length of each list is equal to the *order* + `number of vectors` for the curve.

tess — **specified by user, array of short floating-point numbers**
Array of tessellation quality values. This array must contain one list for each Non-Uniform B-Spline curve with a tessellation quality flag set to a value of one (specified). For other curves, this array is not referenced. The sequence of each list in this array is assumed to match the order of the curve definitions in *curveinfo*. The length of each list is equal to the `number of vectors` - *order* + 1 of the curve.

vwidth — **specified by user, fullword integer**
Specifies the number of fullwords between each entry of the array in *vdata*. If there is any rational curve in the *curveinfo* parameter, this parameter must be at least three. Otherwise, it must be larger than or equal to a value of two.

vdata — **specified by user, array of short floating-point numbers**
This array must contain one list for each curve. The sequence of each list in this array is assumed to match the order of the curve definitions in *curveinfo*. The length of each list is equal to the `number of vectors` specified in the *curveinfo* parameter.

For each entry, the following fields are defined and the fields must be specified in this order without any gap:

x and y components — two short floating-point numbers
weight — short floating-point number

GPCHL2 - Character Line 2

GPCHL2 (*startp*, *endp*, *nomhgt*, *char*)

Purpose

Use **GPCHL2** to insert a Character Line structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Character Line 2 structure element depending on the current edit mode.

When you create **GPCHL2**, the graPHIGS API binds the current character set to this structure element.

During structure traversal, the graPHIGS API draws an integral number of characters between the starting point (*startp* and the ending point (*endp*). The character set and character code (*char*) within the structure element in conjunction with the current font in the traversal state list, determine the characters drawn at each point. If the character set and font combination is not currently active, then the graPHIGS API applies the normal defaulting rules. The height of the characters is the product of the nominal character height (*nomhgt*) and the current Character Line Scale Factor in the traversal state list. The height is subject to all transformations. The actual width of the characters may be adjusted slightly so that there is an integral number between the two endpoints.

The application draws the character in the character line in the *x, y* plane in Modelling Coordinate (MC) space. For the exact method on how text attributes are applied to this primitive, see *The graPHIGS Programming Interface: Understanding Concepts (POWER-based System Only)*.

If the currently active character set and font combination is a double bye character set, then the graPHIGS API ignores this structure element.

GPCHL2 is identified as GDP 1039.

> **Note:** Not all GDPs are supported on all workstations. Use the Inquire List of Generalized Drawing Primitives (**GPQGD**) subroutine to determine the GDPs supported by an opened workstation. See also the workstation description in *The graPHIGS Programming Interface: Technical Reference (POWER-based System Only)*.

Parameters

startp **— specified by user, 2 short floating-point numbers (MC)**
    Starting point.

endp **— specified by user, 2 short floating-point numbers (MC)**
    End point.

nomhgt **— specified by user, short floating-point number (MC)**
    Nominal character height (>0).

char **— specified by user, 1-byte character string**
    Character code.

GPCRA2 - Circular Arc 2

GPCRA2 (*center*, *radius*, *startang*, *endang*)

Purpose

Use **GPCRA2** to insert a Circular Arc 2 structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Circular Arc 2 structure element depending on the current edit mode.

GPCRA2 draws the arc from the starting angle (*startang*) to the end angle (*endang*) through increasing angles. The x-axis, in Modeling Coordinates (MC), serves as the origin for the measurement of angles. All angles are specified in radians. Polyline attributes are applied to this primitive.

GPCRA2 is identified as GDP 1006.

> **Note:** Not all GDPs are supported on all workstations. Use the Inquire List of Generalized Drawing Primitives (**GPQGD**) subroutine to determine the GDPs supported by an opened workstation. See also the workstation description in *The graPHIGS Programming Interface: Technical Reference (POWER-based System Only)*.

Parameters

center — **specified by user, 2 short floating-point numbers (MC)**
Center of arc.

radius — **specified by user, short floating-point number (MC)**
Radius of arc (>=0).

startang — **specified by user, short floating-point number**
Start angle for creation of arc (specified in radians).

endang — **specified by user, short floating-point number**
End angle for creation of arc (specified in radians).

GPDPL2 - Disjoint Polyline 2

GPDPL2 (*npoint*, *width*, *pointlist*, *mdarray*)

Purpose

Use **GPDPL2** to create a two-dimensional, disjoint polyline element and insert it into the open structure following the element pointer or to replace the element pointed at by the element pointer with a two-dimensional, disjoint polyline element depending on the current edit mode.

This structure element defines multiple two-dimensional polylines. Each polyline consists of a number of two-dimensional points (*x, y*) in Modelling Coordinate (MC) space that the graPHIGS API connects by straight lines starting with the first point in the list and ending with the last point in the list. The *z* coordinate is assumed to be zero.

If the application specifies less than two points in the list, then the graPHIGS API does not generate any output for that list. If the application specifies two contiguous points as the same point, then the graPHIGS API generates a point of one pixel in size.

The move/draw indicators(*mdarray*) specify the action required to go from one corresponding point to the next; that is, whether to draw or to move to the next point.

Polyline attributes are applied to this primitive.

GPDPL2 is identified as GDP 1004.

> **Note:** Not all GDPs are supported on all workstations. Use the Inquire List of Generalized Drawing Primitives (**GPQGD**)subroutine to determine the GDPs supported by an opened workstation. See also the workstation description in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

npoint — **specified by user, fullword integer**
> Number of points (>=0).

width — **specified by user, fullword integer**
> Number of fullwords between subsequent*x* values (>=2).

pointlist — **specified by user, array of short floating-point numbers (MC)**
> Array of points specified in row order. The input array contains a list of points in which subsequent*x* values are separated by *width* fullwords.

mdarray — **specified by user, array of fullword integers**
> Move/draw indicators (1=MOVE, 2=DRAW). The last entry of this array is disregarded.

Error Codes

GPDPL3 - Disjoint Polyline 3

GPDPL3 (*npoint*, *width*, *pointlist*, *mdarray*)

Purpose

Use **GPDPL3** to create a three-dimensional, disjoint polyline element and insert it into the open structure following the element pointer or to replace the element pointed at by the element pointer with a three-dimensional, disjoint polyline element depending on the current edit mode.

This structure element defines multiple three-dimensional polylines. Each polyline consists of three-dimensional points (*x*, *y*, *z*) in Modelling Coordinate (MC) space that the graPHIGS API connects by straight lines starting with the first point in the list and ending with the last point in the list.

If the application specifies less than two points, then the graPHIGS API does not generate any output for that list. If the application specifies two contiguous points as the same point, then the graPHIGS API generates a point of one pixel in size.

The move/draw indicators (*mdarray*) specify the action required to go from one corresponding point to the next; that is, whether to draw or move to the next point.

Polyline attributes are applied to this primitive.

GPDPL3 is identified as GDP 1003.

> **Note:** Not all GDPs are supported on all workstations. Use the Inquire List of Generalized Drawing Primitives (**GPQGD**) subroutine to determine the GDPs supported by an opened workstation. See also the workstation description in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

npoint — **specified by user, fullword integer**
Number of points (>=0).

width — **specified by user, fullword integer**

> Number of fullwords between subsequent *x* values (>=3).

pointlist — **specified by user, array of short floating-point numbers (MC)**

> Array of points specified in row order. The input array contains a list of points in which subsequent *x* values are separated by *width* fullwords.

mdarray — **specified by user, array of fullword integers**

> Move/draw indicators (`1=MOVE`, `2=DRAW`). The last entry of this array is disregarded.

GPEL2 - Ellipse 2

> **GPEL2 (*center*, *refv1*, *refv2*)**

Purpose

Use **GPEL2** to insert an Ellipse 2 structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with an Ellipse 2 structure element depending on the current edit mode.

The major and minor axis (*refv1* and *refv2* respectively) parameters define a parallelogram that circumscribes the ellipse and is anchored at the center of the ellipse (*center*). Two sides are parallel to the major axis. The other two sides are parallel to the minor axis. The major and minor axes extend from the center of the ellipse to midpoints of sides of the parallelogram. The ellipse is tangent to the sides of the parallelogram at their midpoints.

Polyline attributes are applied to this primitive.

GPEL2 is identified as GDP 1007.

> **Note:** Not all GDPs are supported on all workstations. Use the Inquire List of Generalized Drawing Primitives (**GPQGD**) subroutine to determine the GDPs supported by an opened workstation. See also the workstation description in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

center — **specified by user, 2 short floating-point numbers (MC)**
Center of ellipse.

refv1 — **specified by user, 2 short floating-point numbers (MC)**
Major axis of ellipse. This direction vector is anchored at the center of the ellipse.

refv2 — **specified by user, 2 short floating-point numbers (MC)**
Minor axis of ellipse. This direction vector is anchored at the center of the ellipse.

GPELA2 - Elliptical Arc 2

GPELA2 (*center*, *refv1*, *refv2*, *startv*, *endv*)

Purpose

Use **GPELA2** to insert an Elliptical Arc 2 structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with an Elliptical Arc 2 structure element depending on the current edit mode.

The graPHIGS API draws the portion of an ellipse (defined by the major and minor axes) specified by the start and end (*startv* and *endv* respectively) parameters.

The major and minor axis (*refv1* and *refv2* respectively) parameters define a parallelogram that circumscribes the ellipse and is anchored at the center of the ellipse. Two sides are parallel to the major axis. The other two sides are parallel to the minor axis. The major and minor axes extend from the center of the ellipse to midpoints of sides of the parallelogram. The ellipse is tangent to the sides of the parallelogram at their midpoints.

The elliptical arc is defined parametrically as the image of an arc of the unit circle in a two-dimensional parameter space. The major and minor axes are images of unit parameter vectors in the *x* and *y* directions respectively. The graPHIGS API draws elliptical drawn from the starting angle to the end angle through increasing parameter values.

Polyline attributes are applied to this primitive.

GPELA2 is identified as GDP 1009.

> **Note:** Not all GDPs are supported on all workstations. Use the Inquire List of Generalized Drawing Primitives (**GPQGD**) subroutine to determine the GDPs supported by an opened workstation. See also the workstation description in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

center — **specified by user, 2 short floating-point numbers (MC)**
 Center of arc.

refv1 — **specified by user, 2 short floating-point numbers (MC)**
 Major axis of ellipse. This direction vector is anchored at the center of the ellipse.

refv2 — **specified by user, 2 short floating-point numbers (MC)**
 Minor axis of ellipse. This direction vector is anchored at the center of the ellipse.

startv — **specified by user, short floating-point number**
 Start value for creation of arc (specified in radians).

endv — **specified by user, short floating-point number**
 End value for creation of arc (specified in radians).

GPLG2 - Line Grid 2

GPLG2 (*point*, *refv1*, *refv2*, *imin*, *imax*, *jmin*, *jmax*)

Purpose

Use **GPLG2** to insert a Line Grid 2 structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Line Grid 2 structure element depending on the current edit mode.

When encountered during structure traversal, this element generates a grid of lines in the z=0 plane of modelling coordinates. Each grid line is defined by the following parametric equations and is subject to all transformations and clipping.

The endpoints of the generated line segments are defined by the following equations. A line segment is generated for each pair of endpoints (P_1, P_2) for each value of i and j.

Line segments parallel to V_1
$P_1(j) = P_0 + i_{min}V_1 + j\ V_2$
$P_2(j) = P_0 + i_{max}\ V_1 + j\ V_2$
where $j_{min} <= j <= j_{max}$

Line segments parallel to V_2
$P_1(i) = P_0 + i\ V_1 + j_{min}\ V_2$
$P_2(i) = P_0 + i\ V_1 + j_{max}V_2$
where $i_{min} <= i <= i_{max}$

Polyline attributes are applied to this primitive.

GPLG2 is identified as GDP 1023.

> **Note:** Not all GDPs are supported on all workstations. Use the Inquire List of Generalized Drawing Primitives (**GPQGD**) subroutine (page GPQGD - Inquire List of Generalized Drawing Primitives) to determine the GDPs supported by an opened workstation. Parameters

point — **specified by user, 2 short floating-point numbers (MC)**
      origin of grid (P_0)

refv1 — **specified by user, 2 short floating-point numbers (MC)**
      i reference vector (V_1). This vector defines the direction of grid lines of constant *j* parameter and the spacing between grid lines of constant *i* parameter.

refv2 — **specified by user, 2 short floating-point number (MC)**
      j reference vector (V_2). This vector defines the direction of grid lines of constant *i* parameter and the spacing between grid lines of constant *j* parameter.

imin — **specified by user, fullword integer**
      Minimum *i* parameter (i_{min}). This value defines the smallest value of *i* that is part of the grid (<= *imax*).

imax — **specified by user, fullword integer**
      Maximum *i* parameter. This parameter defines the largest value of *i* that is part of the grid (>= *imin*).

jmin — **specified by user, fullword integer**
      Minimum *j* parameter. This parameter defines the smallest value of *j* that is part of the grid (<= *jmax*).

jmax — **specified by user, fullword integer**
      Maximum *j* parameter. This parameter defines the largest value of *j* that is part of the grid (>= *jmin*)

GPMG2 - Marker Grid 2

GPMG2 (*point*, *refv1*, *refv2*, *imin*, *imax*, *jmin*, *jmax*)

Purpose

Use **GPMG2** to insert a Marker Grid 2 structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Marker Grid 2 structure element depending on the current edit mode.

When encountered during structure traversal, this element generates a grid of markers in the z=0 plane of modelling coordinates. Each grid location is defined by the following parametric equation and is subject to all transformations and clipping. Each position on the grid is defined by the following parametric vector equation:

$$\mathbf{P}(i,j) = \mathbf{P}_0 + \mathbf{N}_1 + \mathbf{N}_{\#EMPTY>2}$$

$$i_{min} <= i <= i_{max}$$

$$j_{min} <= j <= j_{max}$$

Polymarker attributes are applied to this primitive.

GPMG2 is identified as GDP 1021.

> **Note:** Not all GDPs are supported on all workstations. Use the Inquire List of Generalized Drawing Primitives (**GPQGD**) subroutine to determine the GDPs supported by an opened workstation. See also the workstation description in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

point — **specified by user, 2 short floating-point numbers (MC)**
    origin of grid ($\mathbf{P}_0$).

refv1 — **specified by user, 2 short floating-point numbers (MC)**
    i reference vector ($\mathbf{V}_1$). This vector defines the relative location of the next grid location that is obtained by incrementing the *i* parameter.

refv2 — **specified by user, 2 short floating-point numbers (MC)**
    j reference vector ($\mathbf{V}_2$). This vector defines the relative location of the next grid location that is obtained by incrementing the *j* parameter.

imin — **specified by user, fullword integer**
    Minimum *i* parameter limit (i_{min}). This parameter specifies the smallest value of the *i* parameter at which markers are generated (<= imax).

imax — **specified by user, fullword integer**
    Maximum *i* parameter limit (i_{max}). This parameter specifies the largest value of the *i* parameter at which markers are generated (>=imin).

jmin — **specified by user, fullword integer**
    Minimum *j* parameter limit (j_{min}). This parameter specifies the smallest value of the *j* parameter at which markers are generated (<=jmax).

jmax — **specified by user, fullword integer**

GPNBC2 - Non-Uniform B-Spline Curve 2

GPNBC2 (*order*, *npoint*, *knot*, *tflags*, *tdata*, *cflags*, *cwidth*, *ctlpts*, *tmin*, *tmax*)

Purpose

Use **GPNBC2** to insert a Non-Uniform B-Spline Curve 2 structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Non-Uniform B-Spline Curve 2 structure element depending on the current edit mode.

During structure traversal, the graPHIGS API uses the specified coefficients to generates a a non-uniform B-spline curve of the specified order. The graPHIGS API draws the curve only over the parameter range specified.

Polyline attributes are applied to this primitive.

GPNBC2 is identified as GDP 1034.

> **Note:** Not all GDPs are supported on all workstations. Use the Inquire List of Generalized Drawing Primitives (**GPQGD**) subroutine to determine the GDPs supported by an opened workstation. See also the workstation description in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

order — **specified by user, fullword integer**
> Curve order (>=2).

npoint — **specified by user, fullword integer**
> Number of control points (>= *order*).

knot — **specified by user, array of short floating-point numbers**
> Knot Vector. This array must contain *order*+ *npoint* floating-point numbers representing a non-decreasing sequence of knot values in the parametric space.

tflags — **specified by user, fullword integer**
> Tessellation quality value flags. This parameter shows whether or not the tessellation quality value is specified in the *tdata* parameter.

> | Value | Meaning |
> |---|---|
> | **0** | Not specified. |
> | **1** | Specified. |

tdata — **specified by user, array of short floating-point numbers**
> Array of tessellation quality values. When the *tflags* parameter is set to a value of one, this array must contain *npoint*- *order*+1 tessellation quality values. These value are used in conjunction with Curve Approximation Criteria method 8 to control the number of line segments that are generated for each curve span. The number of line segments generated for this span is approximately the product of this value and the Curve Approximation Criteria control value in the traversal state list.

cflags — **specified by user, fullword integer**
> Control point optional data flags. This parameter shows what data is specified for each control point. The value specified should be the sum of the following values based on the fields that are specified in the *ctlpts* parameter.

> | Value | Meaning |
> |---|---|
> | **0** | Control point coordinates. |
> | **1** | Weight for each control point. This produces the rational form of the Non-Uniform B-Spline Curve. |

cwidth — **specified by user, fullword integer**
> Number of words between subsequent entries of the *ctlpts* parameter.

ctlpts — **specified by user, array of short floating-point numbers (MC)**
> Control point data. This array must contain *npoint* entries. The minimum required width and content of each entry depends on the value of parameter *cflags*. The fields must be specified in the order defined below and no space is allowed between those that are present.

Control point coordinates — 2 short floating-point numbers
> This field must always be present. Therefore, the *cwidth* parameter must be at least two.

Weight — 1 short floating-point number
> Each weight *W* must be greater than zero when specified. If this field is specified, the *cwidth* parameter must be at least three.

> > **Note:** When *W* is specified, the control points are not in homogeneous form (i.e., *XW*, *YW*, *W*). They are specified after division by *W* or (*X*, *Y*, *W*)

tmin **— specified by user, short floating-point number**
> The minimum parameter value at which the curve is evaluated. The curve is evaluated at parameter values between *tmin* and *tmax* inclusive. This value must be greater than or equal to the value of knot *order*.

tmax **— specified by user, short floating-point number**
> The maximum parameter value at which the curve is evaluated. The curve is evaluated at parameter values between *tmin* and *tmax* inclusive. This value must be less than or equal to the value of knot *npoint*+1.

GPNBC3 - Non-Uniform B-Spline Curve 3

GPNBC3 (*order*, *npoint*, *knot*, *tflags*, *tdata*, *cflags*, *cwidth*, *ctlpts*, *tmin*, *tmax*)

Purpose

Use **GPNBC3** to insert a Non-Uniform B-Spline Curve 3 structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Non-Uniform B-Spline Curve 3 structure element depending on the current edit mode.

During structure traversal, the graPHIGS API uses the specified coefficients to generate a a non-uniform B-spline curve of the specified order. The graPHIGS API draws the curve only over the parameter range specified.

Polyline attributes are applied to this primitive.

GPNBC3 is identified as GDP 1033.

> **Note:** Not all GDPs are supported on all workstations. Use the Inquire List of Generalized Drawing Primitives (**GPQGD**) subroutine to determine the GDPs supported by an opened workstation. See also the workstation description in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

order — **specified by user, fullword integer**
Curve order (>=2).

npoint — **specified by user, fullword integer**
Number of control points (>= *order*).

knot — **specified by user, array of short floating-point numbers**
Knot Vector. This array must contain *order*+*npoint* floating-point numbers representing a non-decreasing sequence of knot values in the parametric space.

tflags — **specified by user, fullword integer**
Tessellation quality value flags. This parameter shows whether the tessellation quality value is specified or not in the *tdata* parameter.

Value	Meaning
0	Not specified.
1	Specified.

tdata — **specified by user, array of short floating-point numbers**
Array of tessellation quality values. When the *tflags* parameter is 1, this array must contain *npoint*-*order*+1 tessellation quality values. These values are used in conjunction with Curve Approximation Criteria method 8 to control the number of line segments that are generated for each curve span. The number of line segments generated for this span is approximately the product of this value and the Curve Approximation Criteria control value in the traversal state list.

cflags — **specified by user, fullword integer**
> Control point optional data flags. This parameter shows what data is specified for each control point. The value specified should be the sum of the following values based on the fields that are specified in the *ctlpts* parameter:

> **Value   Meaning**

> **0**   Control point coordinates.

> **1**   Weight for each control point. This produces the rational form of the Non-Uniform B-Spline Curve.

cwidth — **specified by user, fullword integer**
> Number of words between subsequent entries of the *ctlpts* parameter.

ctlpts — **specified by user, array of short floating-point numbers (MC)**
> Control point data. This array must contain *npoint* entries. The minimum required width and content of each entry depends on the value of parameters *cflags*. The fields must be specified in the order defined below and no space is allowed between those that are present.

> **Control point coordinates — 3 short floating-point numbers**
>> This field must always present. Therefore, the *cwidth* parameter must be at least three.

> **Weight — 1 short floating-point number**
>> Each weight *W* must be greater than zero when specified. If this field is specified, the *cwidth* parameter must be at least four.

>> **Note:** When *W* is specified, the control points are not in homogeneous form (i.e.,*XW*, *YW*, *ZW*, *W*). They are specified after division by *W* or (*X*, *Y*, *Z*, *W*).

tmin — **specified by user, short floating-point number**
> The minimum parameter value at which the curve is evaluated. The curve is evaluated at parameter values between *tmin* and *tmax* inclusive. This value must be greater than or equal to the value of knot *order*.

tmax — **specified by user, short floating-point number**
> The maximum parameter value at which the curve is evaluated. The curve is evaluated at parameter values between *tmin* and *tmax* inclusive. This value must be less than or equal to the value of knot *npoint*+1.

GPNBS - Non-Uniform B-Spline Surface

> GPNBS (*uorder*, *vorder*, *unum*, *vnum*, *uknots*, *vknots*, *tflag*, *utdata*, *vtdata*, *cflags*, *cwidth*, *ctlpts*, *umin*, *umax*, *vmin*, *vmax*)

Purpose

Use **GPNBS** to insert a Non-Uniform B-Spline Surface structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Non-Uniform B-Spline Surface structure element depending on the current edit mode.

During structure traversal, the graPHIGS API uses the specified control points to generate a non-uniform parametric surface of the specified *uorder* and *vorder*. The graPHIGS API renders only the portion of the surface within the parameter limits.

If the specified workstation does not support the requested orders for the basis functions of the surface, then this primitive does not generate any output.

The lines of constant parameter at the parameter limits of the surface are rendered as edges.

Polygon and surface attributes are applied to this primitive.

GPNBS is identified as GDP 1035.

> **Note:** Not all GDPs are supported on all workstations. Use the Inquire List of Generalized Drawing Primitives (**GPQGD**) subroutine to determine the GDPs supported by an opened workstation. See also the workstation description in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

uorder — **specified by user, fullword integer**
> Order of the basis functions for the *u* parameter (>=2).

vorder — **specified by user, fullword integer**
> Order of the basis functions for the *v* parameter (>=2).

unum — **specified by user, fullword integer**
> Number of surface control points for the *u* direction (>=*uorder*).

vnum — **specified by user, fullword integer**
> Number of surface control points for the *v* direction (>=*vorder*).

uknots — **specified by user, array of short floating-point numbers**
> Knot values for the *u* parameter. The length of this array must be *uorder*+ *unum*. This parameter must be a non-decreasing knot value sequence.

vknots — **specified by user, array of short floating-point numbers**
> Knot values for the *v* parameter. The length of this array must be *vorder*+ *vnum*. This parameter must be a non-decreasing knot value sequence.

tflag — **specified by user, fullword integer**
> Surface tessellation quality value flag. This parameter shows whether the tessellation quality values are specified or not.

> **0**   Not specified.

> **1**   Specified.

utdata — **specified by user, array of short floating-point numbers**
> Tessellation quality values for the *u* direction. When the *tflag* parameter is set to a value of one, this parameter must contain *unum*- *uorder*+1 quality values. These value are used in conjunction with Surface Approximation Criteria method 8 to control the number of sub-divisions made in the *u* direction. The number of sub-divisions that are performed for a patch is approximately the product of this value and the Surface Approximation Criteria control value (*u*) in the traversal state list.

vtdata — **specified by user, array of short floating-point numbers**
> Tessellation quality values for the *v* direction. When the *tflag* parameter is set to a value of one, this parameter must contain *vnum*- *vorder*+1 quality values. These value are used in conjunction with Surface Approximation Criteria method 8 to control the number of sub-divisions made in the *v* direction. The number of sub-divisions that are performed for a patch is approximately the product of this value and the Surface Approximation Criteria control value (*v*) in the traversal state list.

cflags — **specified by user, fullword integer**
> Control point optional data flags. This parameter shows what data is specified for each control point. The value specified should be the sum of the following values based on the fields that are specified in the *ctlpts* parameter.

> **Value**   **Meaning**

> **0**   Control point coordinates.

> **1**   Weights are specified with each control point. This produces the rational form of the Non-Uniform B-Spline Surface.

cwidth — **specified by user, fullword integer**
> Number of words between subsequent entries of control points array *ctlpts*

ctlpts — **specified by user, array of short floating-point numbers.**
> Grid of control points. The control points are stored by row where a row is considered to be the direction associated with the *u* parameter. For example, the set of control points

```
            ^
            |  m   n   o   p
            |
            |  i   j   k   l
Increasing v|
            |  e   f   g   h
            |
            |  a   b   c   d
            ----------------->
                Increasing u
```

would be stored in the order a, b, c, d, e, f, g, h, i, j, k, l, m, n, o, and p. The *cwidth* parameter must be at least three. If *cflags* specifies that weights are included with each control point, then the *cwidth* parameter must be at least four. Each weight *W* must be greater than zero when specified.

> **Note:** When *W* is specified, the control points are not in homogeneous form (i.e.,*XW*, *YW*, *ZW*, *W*). They are specified after division by *W* or (*X*, *Y*, *Z*, *W*).

umin — **specified by user, short floating-point number**
The minimum parameter value in the *u* dimension at which the surface is evaluated. This value must be greater than or equal to the value of knot *uorder* in parameter *uknots*.

umax — **specified by user, short floating-point number**
The maximum parameter value in the *u* dimension at which the surface is evaluated. This value must be less than or equal to the value of knot *unum*+1 in parameter *uknots*

vmin — **specified by user, short floating-point number**
The minimum parameter value in the *v* dimension at which the surface is evaluated. This value must be greater than or equal to the value of knot *vorder* in parameter *vknots*

vmax — **specified by user, short floating-point number**
The maximum parameter value in the *v* dimension at which the surface is evaluated. This value must be less than or equal to the value of knot *vnum*+1 in parameter *vknots*

GPPGD2 - Polygon 2 With Data

GPPGD2 (*pflags*, *pdata*, *saflags*, *sawidth*, *sadata*, *vxflags*, *vxwidth*, *vxdata*)

Purpose

Use **GPPGD2** to insert a Polygon 2 With Data structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Polygon 2 With Data structure element depending on the current edit mode.

When encountered during structure traversal, this element generates a polygon with the specified number of subareas. You may specify optional data to further control the rendering of this primitive. The optional data consists of:

* Convexity flag.

  The convexity flag indicates that the application determined the convexity of the polygon primitive. Therefore, the system rendering code does not have to determine the convexity every time the primitive is rendered. To determine the convexity of a set of polygons, the graPHIGS API on the RS/6000 contains a sample program under the directory: **/usr/lpp/graPHIGS/samples/convexcheck**

* Vertex colors.

  When rendering this primitive, if the primitive is not to be highlighted, then the graPHIGS API uses the specified vertex color. The colors are used in the lighting process to produce more realistic effects.

* Boundary flags.

  When rendering this primitive, if the current edge flag attribute is set to 2=ON, then the graPHIGS API renders as part of the edge, only the parts of the polygon defined by the boundary flags to be part of the edge. If there are no boundary flags specified, then the graPHIGS API treats it the same as a polygon (i.e., all boundaries are rendered as edges)

* Transparency coefficients.

  You can specify a transparency coefficient per vertex. The graPHIGS API uses these values when producing transparency effects for the rendered primitive.

* Vertex morphing vectors.

  You can supply vertex morphing vectors per vertex. The graPHIGS API combines these vectors with the vertices and vertex morphing scale factors (**GPVMF**)to create new vertex coordinate values for the rendered primitive.

* Data mapping data.

  You can specify data mapping data per vertex. The graPHIGS API uses these values to determine the colors of the rendered primitive.

* Data morphing vectors.

  You can specify data morphing vectors per vertex. The graPHIGS API combines these vectors with the data morphing scale factors (**GPDMF**) and (**GPBDMF**) and the vertex data mapping values to create new data mapping data values for the rendered primitive.

See *The graPHIGS Programming Interface: Understanding Concepts* for a more complete explanation of how the graPHIGS API uses the various optional data values.

> **Note:** This note applies ONLY to applications which will be run on the High Performance 3D Color Graphics Processor (8 or 24 bit). Use of any optional data other than the convexity flag, vertex colors, and boundary flags may cause unpredictable results (including locking the display) on this graphics processor. If only the High Performance 3D Color Graphics Processor is used, you should include only the supported optional data values. If your application must support multiple graphics processors INCLUDING this particular processor, the Inquire Workstation Description (**GPQWDT**)

subroutine must be used to determine the functions that each workstation supports. See also the workstation description in *The graPHIGS Programming Interface: Technical Reference* for the High Performance 3D Color Graphics Processor.

The normal of a Polygon 2 With Data is (0,0,1). All points specified are placed in the *x-y* plane (`z=0`). Polygon attributes are applied to this primitive.

GPPGD2 is identified as GDP 1017.

> **Note:** Not all GDPs are supported on all workstations. Use the Inquire List of Generalized Drawing Primitives (**GPQGD**) subroutine to determine the GDPs supported by an opened workstation. See also the workstation description in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

pflags — **specified by user, fullword integer**
> Shows what optional data is specified for the primitive. The value specified should be the sum of the following values based on the fields that are included in the *pdata* parameter.

> | Value | Corresponding Field |
> |---|---|
> | **0** | Number of subareas. |
> | **2** | Convexity flag is specified. |
> | **4** | Count of vertex morphing vectors is specified. |
> | **8** | Count of data mapping data is specified. |
> | **16** | Count of data morphing vectors is specified. |

pdata — **specified by user, array of primitive data**
> Contains specific information about the entire primitive. The presence of optional fields is determined by the value of the *pflags* parameter. The fields must be specified in the order defined below and no space is allowed between those that are present.

> **Number of Subareas — fullword integer (>=0)**
> > Number of contours in the polygon definition. This field is required.

> **Convexity flag — fullword integer**
> > This data indicates that the application determined the convexity of the polygon (`0=CONCAVE`, `1=CONVEX`). This field is optional.

> **Vertex Morphing Vector Count — fullword integer (>=0)**
> > The number of vertex morphing vectors specified at each vertex. The number of fullwords of vertex morphing vector data added to the other fullwords of vertex data specified per vertex cannot exceed 255 fullwords. This field is optional.

> **Data Mapping Data Count — fullword integer (>=0)**
> > The number of data mapping values specified at each vertex. The number of data mapping values added to the other fullwords of vertex data specified per vertex cannot exceed 255 fullwords. This field is optional.

> **Data Morphing Vector Count — fullword integer (>=0)**
> > The number of data morphing vectors specified at each vertex. The number of fullwords of data morphing vector data added to the other fullwords of vertex data specified per vertex cannot exceed 255 fullwords. This field is optional.

saflags — **specified by user, fullword integer**

> Shows what optional data is specified for each subarea. The value specified should be the sum of the following values based on the fields that are included in the *sadata* parameter.

> **Value Corresponding Field**

> **0**   Number of vertices. (There is no optional data currently defined. This field must be set to zero)

sawidth — **specified by user, fullword integer**

> Number of words between subsequent entries of the *sadata* parameter array (>=1)

sadata — **specified by user, array of per subarea data**

> Contains specific information about each subarea in the primitive. The length of this array is defined by the contents of the `number of subareas` field in the *pdata* parameter. The presence of optional fields is determined by the value of the *saflags* parameter. The fields must be specified in the order defined below and no space is allowed between those that are present.

> **Number of Vertices — fullword integer (>=0)**

> > Number of vertices in each subarea. If the number is less than three, the result is workstation dependent. This field is required for each subarea.

vxflags — **specified by user, fullword integer**

> Shows what optional data is specified for each vertex. The value specified should be the sum of the following values based on the fields that are specified in the *vxdata* parameter.

> **Value Meaning**

> **0**   Vertex coordinates are specified.

> **2**   Vertex colors are specified.

> **4**   Boundary flags are specified.

> **8**   Transparency coefficient is specified.

> **16**   Vertex morphing vectors are specified.

> **32**   Data mapping data is specified.

> **64**   Data morphing vectors are specified (valid only if data mapping data is specified also).

vxwidth — **specified by user, fullword integer**

> Number of words between subsequent entries of the *vxdata* parameter array (>=2)

vxdata — **specified by user, array of vertex data**

> Contains specific information about each vertex in the primitive. The length of this array is equal to the sum of the `number of vertices` fields in the *sadata* parameter. The presence of optional fields is determined by the value of the *vxflags* parameter. The fields must be specified in the order defined below and no space is allowed between those that are present.

> **Coordinates — 2 short floating-point numbers (MC)**

> > *x* and *y* coordinates of a vertex. This field is required.

> **Color — 3 short floating-point numbers**

> > The three components of a color in the current color model as contained in the graPHIGS API state list. This field is optional.

> **Boundary Flags — fullword integer**

> > Specifies whether the corresponding boundary is to be treated as an edge of the polygon (1=NOT_AN_EDGE, 2=IS_AN_EDGE). These flags allow control over which parts of the

polygon's boundary are to be treated as edges. The edge attributes are only applied to boundary segments that have a boundary flag set to a value of `2=IS_AN_EDGE`.

Each entry of this array specifies whether the graPHIGS API draws the boundary from the corresponding vertex to the following vertex. The last entry for each subarea corresponds to the boundary from the last vertex to the first. This field is optional.

Transparency Coefficient — short floating-point number (0.0 <= transparency coefficient <=1.0) The transparency coefficient value used when performing transparency processing. A value of 0.0 is fully opaque; a value of 1.0 is fully transparent. This field is optional.

Vertex Morphing Vectors — array of short floating-point numbers
The vertex morphing vectors dx_1, dy_1, dx_2, dy_2, ..., dx_n, dy_n. The number, n, of vectors in this array is specified in the *pdata* parameter as the vertex morphing vector count. The array must be the same length for every vertex. This field is optional.

Data Mapping Data — array of short floating-point numbers
The data mapping data values x_1, x_2, x_3, ..., x_n. The number, n, of values in this array is specified in the *pdata* parameter as the data mapping data count. The array must be the same length for every vertex. This field is optional.

Data Morphing Vectors — array of short floating-point numbers
The data morphing vectors d_{11}, d_{12}, d_{13}, ..., d_{1n}, d_{21}, d_{22}, d_{23}, ..., d_{2n}, ..., d_{m1}, d_{m2}, d_{m3}, ..., d_{mn}. The number, n, is specified in the *pdata* parameter as the data mapping data count, and the number, m is specified in the *pdata* parameter as the data morphing vector count. The array must be the same length for every vertex. This field is optional.

GPPGD3 - Polygon 3 With Data

GPPGD3 (*pflags*, *pdata*, *saflags*, *sawidth*, *sadata*, *vxflags*, *vxwidth*, *vxdata*)

Purpose

Use **GPPGD3** to insert a Polygon 3 With Data structure element into the open structure following the element pointer or replace the element pointed at by the element pointer with a Polygon 3 With Data structure element depending on the current edit mode.

When encountered during structure traversal, this element generates a polygon with the specified number of subareas. You may specify optional data to further control the rendering of this primitive. The optional data consists of:

*   Convexity flag.

    The convexity flag indicates that the application determined the convexity of the polygon primitive. Therefore, the system rendering code does not have to determine the convexity every time the primitive is rendered. To determine the convexity of a set of polygons, the graPHIGS API on the RS/6000 contains a sample program under the directory: **/usr/lpp/graPHIGS/samples/convexcheck**

*   Normals.

    You can specify a geometric normal of the polygon and/or a normal for each vertex of the polygon. The normals are used in the lighting process to produce more realistic effects.

*   Vertex colors.

    When rendering this primitive, if the primitive is not to be highlighted, then the graPHIGS API uses the specified vertex color. The colors are used in the lighting process to produce more realistic effects.

*   Boundary flags.

    When rendering this primitive, if the current edge flag attribute is set to 2=ON, then the graPHIGS API renders as part of the edge, only the parts of the polygon defined by the boundary flags to be part of the edge. If there are no boundary flags specified, then it is treated the same as a polygon (i.e. all boundaries are rendered as edges)

*   Transparency Coefficients.

    You can specify a transparency coefficient per vertex. The graPHIGS API uses these values when producing transparency effects for the rendered primitive.

*   Vertex morphing vectors.

    You can supply vertex morphing vectors per vertex. The graPHIGS API combines these vectors with the vertices and vertex morphing scale factors (**GPVMF**) to create new vertex coordinate values for the rendered primitive.

*   Data mapping data.

    You can specify data mapping data per vertex. The graPHIGS API uses these values to determine the colors of the rendered primitive.

*   Data morphing vectors.

    You can specify data morphing vectors per vertex. The graPHIGS API combines these vectors with the data morphing scale factors (**GPDMF**) and (**GPBDMF**) and the vertex data mapping values to create new data mapping data values for the rendered primitive.

See *The graPHIGS Programming Interface: Understanding Concepts* for a more complete explanation of how the graPHIGS API uses the various optional data values.

Note: This note applies ONLY to applications which will be run on the High Performance 3D Color Graphics Processor (8 or 24 bit). Use of any optional data other than the convexity flag, polygon normal, vertex normals, vertex colors, and boundary flags may cause unpredictable results (including locking the display) on this graphics processor. If only the High Performance 3D Color Graphics Processor is used, you should include only the supported optional data values. If your application must support multiple graphics processors INCLUDING this particular processor, the Inquire Workstation Description (**GPQWDT**) subroutine must be used to determine the functions that each workstation supports. See also the workstation description in *The graPHIGS Programming Interface: Technical Reference* for the High Performance 3D Color Graphics Processor.

All points specified must lie in the same plane, the graPHIGS API makes no check to verify this. The system behavior is undefined in this case.

Polygon attributes are applied to this primitive.

GPPGD3 is identified as GDP 1016.

Note: Not all GDPs are supported on all workstations. Use the Inquire List of Generalized Drawing Primitives (**GPQGD**) subroutine to determine the GDPs supported by an opened workstation. See also the workstation description in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

pflags — **specified by user, fullword integer**
Shows what optional data is specified for the primitive. The value specified should be the sum of the following values based on the fields that are included in the *pdata* parameter.

Value	Corresponding Field
0	Number of subareas
1	Geometric normal is specified.
2	Convexity flag is specified.
4	Count of vertex morphing vectors is specified.
8	Count of data mapping data is specified.
16	Count of data morphing vectors is specified.

pdata — **specified by user, array of primitive data**
Contains specific information about the entire primitive. The presence of optional fields is determined by the value of the *pflags* parameter. The fields must be specified in the order defined below and no space is allowed between those that are present.

Number of Subareas — fullword integer (>=0)
Number of contours in the polygon definition. This field is required.

Geometric Normal — 3 short floating-point numbers (MC)
Geometric normal to be used in processing this polygon. This field is optional.

Convexity Flag — fullword integer
This data indicates that the application determined the convexity of the polygon (`0=CONCAVE, 1=CONVEX`). This field is optional.

Vertex Morphing Vector Count — fullword integer (>=0)
This number of vertex morphing vectors specified at each vertex. The number of fullwords

of vertex morphing vector data added to the other fullwords of vertex data specified per vertex cannot exceed 255 fullwords. This field is optional.

Data Mapping Data Count — fullword integer (>=0)
The number of data mapping values specified at each vertex. The number of data mapping values added to the other fullwords of vertex data specified per vertex cannot exceed 255 fullwords. This field is optional.

Data Morphing Vector Count — fullword integer (>=0)
The number of data morphing vectors specified at each vertex. The number of fullwords of data morphing vector data added to the other fullwords of vertex data specified per vertex cannot exceed 255 fullwords. This field is optional.

saflags — **specified by user, fullword integer**
Shows what optional data is specified for each subarea. The value specified should be the sum of the following values based on the fields that are included in the *sadata* parameter.

Value **Corresponding Field**

0   Number of vertices. (There is no optional data currently defined. This field must be set to zero.)

sawidth — **specified by user, fullword integer**
Number of words between subsequent entries of the *sadata* parameter array (>=1)

sadata — **specified by user, array of per subarea data**
Contains specific information about each subarea in the primitive. The length of this array is defined by the contents of the `number of subareas` field in the *pdata* parameter. The presence of optional fields is determined by the value of the *saflags* parameter. The fields must be specified in the order defined below and no space is allowed between those that are present.

Number of Vertices — fullword integer (>=0)
Number of vertices in each subarea. If the number is less than three, the result is workstation dependent. This field is required for each subarea.

vxflags — **specified by user, fullword integer**
Shows what optional data is specified for each vertex. The value specified should be the sum of the following values based on the fields that are specified in the *vxdata* parameter.

Value **Meaning**

0   Vertex coordinates are specified.

1   Vertex normals are specified.

2   Vertex colors are specified.

4   Boundary flags are specified.

8   Transparency coefficient is specified.

16   Vertex morphing vectors are specified.

32   Data mapping data is specified.

64   Data morphing vectors are specified (valid only if data mapping data is specified also).

vxwidth — **specified by user, fullword integer**
Number of words between subsequent entries of the *vxdata* parameter array (>=3)

vxdata — **specified by user, array of vertex data**

Contains specific information about each vertex in the primitive. The length of this array is equal to the sum of the `number of vertices` fields in the *sadata* parameter. The presence of optional fields is determined by the value of the *vxflags* parameter. The fields must be specified in the order defined below and no space is allowed between those that are present.

Coordinates — 3 short floating-point numbers (MC)

x, y, and *z* coordinates of a vertex. This field is required.

Normal — 3 short floating-point numbers (MC)

The three components of a vector that is to be used as the normal of the polygon at the corresponding vertex. This field is optional.

Color — 3 short floating-point numbers

The three components of a color in the current color model as contained in the graPHIGS API state list. This field is optional.

Boundary Flags — fullword integer

Specifies whether the corresponding boundary is to be treated as an edge of the polygon (1=`NOT_AN_EDGE`, 2=`IS_AN_EDGE`). These flags allow control over which parts of the polygon's boundary are to be treated as edges. The edge attributes are only applied to boundary segments that have a boundary flag set to the value of 2=`IS_AN_EDGE`.

Each flag specifies whether the boundary from the corresponding vertex to the following vertex is to be drawn. The last entry for each subarea corresponds to the boundary from the last vertex to the first. This field is optional.

Transparency Coefficient — short floating-point number (0.0 <= transparency coefficient <=1.0) The transparency coefficient value used when performing transparency processing. A value of 0.0 is fully opaque; a value of 1.0 is fully transparent. This field is optional.

Vertex Morphing Vectors — array of short floating-point numbers

The vertex morphing vectors dx_1, dy_1, dz_1, dx_2, dy_2, dz_2, ..., dx_n, dy_n, dz_n. The number, n, of vectors in this array is specified in the *pdata* parameter as the vertex morphing vector count. The array must be the same length for every vertex. This field is optional.

Data Mapping Data — array of short floating-point numbers

The data mapping data values x_1, x_2, x_3, ..., x_n. The number, n, of values in this array is specified in the *pdata* parameter as the data mapping data count. The array must be the same length for every vertex. This field is optional.

Data Morphing Vectors — array of short floating-point numbers

The data morphing vectors $d_{11}>$, $d_{12}>$, $d_{13}>$, ..., $d_{1n}>$, $d_{21}>$, $d_{22}>$, $d_{23}>$, ..., $d_{2n}>$, ..., d_{m1}, d_{m2}, d_{m3}, ..., d_{mn}. The number, n, is specified in the *pdata* parameter as the data mapping data count, and the number, m is specified in the *pdata* parameter as the data morphing vector count. The array must be the same length for every vertex. This field is optional.

GPPG2 - Polygon 2

GPPG2 (*areas*, *npoint*, *width*, *pointlist*)

Purpose

Use **GPPG2** to specify a two-dimensional polygon primitive and insert it into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Polygon 2 structure element depending on the current edit mode.

This structure element defines the boundary of contours which may be hollow or filled with a uniform color, a pattern, or a hatch style. You can display the boundary of the primitive with or without an edge. The normal on Polygon 2 is (0,0,1).

All points specified are placed in the *x*, *y* plane. Polygon attributes are applied to this primitive.

Parameters

areas — **specified by user, fullword integer**
>   Number of subareas (>=0).

npoint — **specified by user, array of fullword integers**
>   Number of points per subarea (>=0).

width — **specified by user, fullword integer**
>   Number of fullwords between subsequent *x* values (>=2).

pointlist — **specified by user, array of short floating-point numbers (MC)**
>   Array of points specified in row order.
>
>   The input array contains a list of points in which subsequent *x* values are separated by *width* fullwords.

For the i th subarea, the array contains 2 x npoint(i) short floating-point numbers. The pointlist is a continuous list of points with the points for subarea i+1 immediately following those of subarea i.

All points in the pointlist must be coplanar.

GPPG3 - Polygon 3

GPPG3 (*areas, npoint, width, pointlist*)

Purpose

Use **GPPG3** to specify a three-dimensional polygon primitive element and insert it into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Polygon 3 structure element depending on the current edit mode.

This structure element defines the boundary of contours which may be hollow or filled with a uniform color pattern, or hatch style. You can display the boundary of the primitive with or without an edge.

All points specified must lie in the same plane, but the graPHIGS API does not check to verify this. The system behavior is undefined in this case.

Polygon attributes are applied to this primitive.

Parameters

areas — **specified by user, fullword integer**
> Number of subareas (>=0).

npoint — **specified by user, array of fullword integers**
> Number of points per subarea (>=0).

width — **specified by user, fullword integer**
> Number of fullwords between subsequent *x* values (>=3).

pointlist — **specified by user, array of short floating-point numbers (MC)**
> Array of points specified in row order. The input array contains a list of points in which subsequent *x* values are separated by *width* fullwords.

> For the ith subarea, the array contains 3 x npoint(i) short floating-point numbers. The pointlist is a continuous list of points with the points for subarea *i*+1 immediately following those of subarea *i*. All points in the pointlist must be coplaner.

GPPHE - Polyhedron Edge

GPPHE (*nedge, edgelist*)

Purpose

Use **GPPHE** to insert a Polyhedron Edge structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Polyhedron Edge structure element depending on the current edit mode.

You can use this primitive to simulate the edge of a polyhedron type object. The two normals identify the orientation of the faces which intersect and result in the line segment defined by the two endpoints.

During structure traversal, the graPHIGS API uses the polyline attributes and Polyhedron Edge Culling mode (**GPPHEC**) from the traversal state list to render each line segment defined by two end points. The Polyhedron Edge Culling mode along with two associated normals within an *edgelist* entry may suppress rendering of this line segment.

All normal vectors are normalized by the graPHIGS API. If the application later inquires the content of this structure element, then the graPHIGS API returns the normalized vectors *not* the original vectors specified on this subroutine.

GPPHE is identified as GDP 1037.

> **Note:** Not all GDPs are supported on all workstations. (**GPQGD**) subroutine to determine the GDPs supported by an opened workstation. See also the workstation description in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

nedge — **specified by user, fullword integer**
Number of edges (>=1)

edgelist — **specified by user, array of 12 short floating-point numbers (MC)**
Array of polyhedron edge descriptors. Each polyhedron descriptor consists of the *x*, *y*, and *z* coordinates of two normal vectors and two end points in this order.

GPPL2 - Polyline 2

GPPL2 (*npoint*, *width*, *pointlist*)

Purpose

Use **GPPL2** to create a two-dimensional polyline element and insert it into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Polyline 2 structure element depending on the current edit mode.

This structure element defines a list of two-dimensional points (*x*, *y*) (the *z* coordinate is assumed to be zero) that the graPHIGS API is to connect by straight lines starting with the first point and ending with the last point.

If the application specifies one point or less, then no output is generated. If the application specifies two contiguous points as the same point, then the graPHIGS API generates a point of one pixel in size.

Polyline attributes are applied to this primitive.

Parameters

npoint — **specified by user, fullword integer**
        Number of points (>=0).

width — **specified by user, fullword integer**
        Number of fullwords between subsequent *x* values (>=2).

pointlist — **specified by user, array of short floating-point numbers (MC)**
        Array of points specified in row order.

        The input array contains a list of points in which subsequent *x* values are separated by *width* fullwords.

GPPLD3 - Polyline Set 3 With Data

GPPLD3 (*pflags*, *pdata*, *plflags*, *plwidth*, *pldata*, *vxflags*, *vxwidth*, *vxdata*)

Purpose

Use **GPPLD3** to insert a Polyline Set 3 With Data structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Polyline Set 3 With Data structure element depending on the current edit mode.

This structure element defines multiple three-dimensional polylines within one structure element. This is similar to the Disjoint Polyline 2 (**GPDPL2**) subroutine and the Disjoint Polyline 3 (**GPDPL3**) subroutine, except in its specification. When encountered during structure traversal, this element generates an unconnected sequence of polylines from the list of points specified.

Your application can specify optional data to further control the rendering of this primitive. The optional data consists of:

- Vertex colors.

  When rendering this primitive, if the primitive is not to be highlighted, then the graPHIGS API uses the specified vertex colors. If the current polyline shading method is `1=POLYLINE_SHADING_NONE` (default), then the graPHIGS API uses the ith vertex color to color the ith line of the polyline. If the current polyline shading method is `2=POLYLINE_SHADING_COLOR`, then the graPHIGS API interpolates the color along each line between the colors specified at the endpoints of the line. If your application does not specify the vertex color data in this primitive definition, then the graPHIGS API uses the current polyline color to render **GPPLD3**.

- Vertex morphing vectors.

  You can supply vertex morphing vectors per vertex. The graPHIGS API combines these vectors with the vertices and vertex morphing scale factors (**GPVMF**) to create new vertex coordinate values for the rendered primitive.

See *The graPHIGS Programming Interface: Understanding Concepts* for a more complete explanation of how the graPHIGS API uses the various optional data values.

> **Note:** This note applies ONLY to applications which will be run on the High Performance 3D Color Graphics Processor (8 or 24 bit). Use of any optional data other than vertex colors may cause unpredictable results (including locking the display) on this graphics processor. If only the High

Performance 3D Color Graphics Processor is used, you should include only the supported optional data values. If your application must support multiple graphics processors INCLUDING this particular processor, the Inquire Workstation Description (**GPQWDT**) subroutine must be used to determine the functions that each workstation supports. See also the workstation description in *The graPHIGS Programming Interface: Technical Reference* for the High Performance 3D Color Graphics Processor.

Polyline attributes are applied to this primitive.

GPPLD3 is identified as GDP 1014.

> **Note:** Not all GDPs are supported on all workstations. Use the Inquire List of Generalized Drawing Primitives (**GPQGD**) subroutine to determine the GDPs supported by an opened workstation. See also the workstation description in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

pflags — **specified by user, fullword integer**
> Shows what optional data is specified for the primitive. The value specified should be the sum of the following values based on the fields that are included in the *pdata* parameter.

> **Value** **Corresponding Field**

> **0**   Number of polylines.

> **4**   Count of vertex morphing vectors is specified.

pdata — **specified by user, array of primitive data**
> Contains specific information about the entire primitive. The presence of optional fields is determined by the value of the *pflags* parameter. The fields must be specified in the order defined below and no space is allowed between those that are present.

> **Number of Polylines — fullword integer (>=0)**
> > Number of specified polylines. This field is required.

> **Vertex Morphing Vector Count — fullword integer (>=0)**
> > The number of vertex morphing vectors specified at each vertex. The number of fullwords of vertex morphing vector data added to the other fullwords of vertex data specified per vertex cannot exceed 255 fullwords. This field is optional.

plflags — **specified by user, fullword integer**
> Shows what optional data is specified for each polyline. The value specified should be the sum of the following values based on the fields that are included in the *pldata* parameter.

> **Value** **Corresponding Field**

> **0**   Number of vertices in each polyline. (There is no optional data currently defined. This field must be set to zero).

plwidth — **specified by user, fullword integer**
> Number of words between subsequent entries of the *pldata* parameter array (>=1).

pldata — **specified by user, array of per polyline data**
> Contains specific information about each polyline in the primitive. The length of this array is defined by the contents of the `number of polylines` field in the *pdata* parameter. The presence of optional fields is determined by the value of the *plflags* parameter. The fields must be specified in the order defined below and no space is allowed between those that are present.

Number of Vertices — fullword integer (>=0)

Number of vertices in each polyline. If the number is less than two, then no lines are generated. This field is required for each polyline.

vxflags **— specified by user, fullword integer**

Shows what optional data is specified for each vertex. The value specified should be the sum of the following values based on the fields that are specified in the *vxdata* parameter.

Value   Meaning

0   Vertex coordinates are specified.

2   Vertex colors are specified.

16   Vertex morphing vectors are specified.

vxwidth **— specified by user, fullword integer**

Number of words between subsequent entries of the *vxdata* parameter array (>=3).

vxdata **— specified by user, array of vertex data**

Contains specific information about each vertex in the primitive. The length of this array is equal to the sum of the `number of vertices` fields in the *pldata* parameter. The presence of optional fields is determined by the value of the *vxflags* parameter. The fields must be specified in the order defined below and no space is allowed between those that are present.

Coordinates — 3 short floating-point numbers (MC)

x, y and *z* coordinates of each vertex. This field is required.

Color — 3 short floating-point numbers (0.0<=component<=1.0)

The three components of a color in the current color model as contained in the graPHIGS API state list. This field is optional.

Vertex Morphing Vectors — array of short floating-point numbers

The vertex morphing vectors dx_1, dy_1, dz_1, dx_2, dy_2, dz_2, ..., dx_n, dy_n, dz_n. The number, *n*, of vectors in this array is specified in the *pdata* parameter as the vertex morphing vector count. The array must be the same length for every vertex. This field is optional.

GPPM2 - Polymarker 2

GPPM2 (*npoint, width, pointlist*)

Purpose

Use **GPPM2** to create a two-dimensional polymarker element and insert it into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Polymarker 2 structure element depending on the current edit mode.

This structure element defines a list of two-dimensional points (*x, y*) that the graPHIGS API identifies by markers and renders in Device Coordinate (DC) space parallel to the display surface.

If the primitive does not specify any points, it is ignored.

Polymarker attributes are applied to this primitive.

Parameters

npoint — **specified by user, fullword integer**
>Number of points (>=0)

width — **specified by user, fullword integer**
>Number of fullwords between subsequent *x* values (>=2)

pointlist — **specified by user, array of short floating-point numbers (MC)**
>Array of points specified in row order. The input array contains a list of points in which subsequent *x* values are separated by *width* fullwords.

GPPXL2 - Pixel 2

GPPXL2 (*point*, *pack*, *numrow*, *numcol*, *startrow*, *startcol*, *nrow*, *ncol*, *array*)

Purpose

Use **GPPXL2** to insert a Pixel 2 element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Pixel 2 structure element depending on the current edit mode.

This structure element defines a two-dimensional rectangular array of pixels that the application writes into the frame buffer of a workstation. The pixel values specify indexes into the workstation's display color table. Only the low order byte of the pixel array is used and preserved by this primitive. The graPHIGS API assumes the primitive exists in the z=0 plane.

GPPXL2 is identified as GDP 1002.

> **Note:** Not all GDPs are supported on all workstations. Use the Inquire List of Generalized Drawing Primitives (**GPQGD**) subroutine to determine the GDPs supported by an opened workstation. See also the workstation description in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

point — **specified by user, 2 short floating-point numbers (MC)**
x and y coordinates of the upper left corner for start of pixel rectangle.

pack — **specified by user, fullword integer**
Specifies the packing factor of the pixel color indexes in the input array (8 BITS/PIXEL, 16 BITS/PIXEL, 32 BITS/PIXEL). The interpretation of the following parameters depends on this value. The graPHIGS API uses the least significant 8 bits only.

numrow — **specified by user, fullword integer**
Number of rows in the input array (>=1).

numcol — **specified by user, fullword integer**
Number of columns in the input array (>=1).

startrow — **specified by user, fullword integer**
Row within array that is the start of the data (>=1).

startcol — **specified by user, fullword integer**
Column within array that is the start of the data (>=1).

nrow — **specified by user, fullword integer**
> Number of rows within array to be used for display beginning at the starting position (>=1).

ncol — **specified by user, fullword integer**
> Number of columns within the array to be used for display beginning at the starting position (>=1).

array — **specified by user, array of integers (as defined by the packing factor)**
> A grid of *numrow* by *numcol* color indexes. The array must be in row order.

GPPXL3 - Pixel 3

> **GPPXL3 (*point*, *pack*, *numrow*, *numcol*, *startrow*, *startcol*, *nrow*, *ncol*, *array*)**

Purpose

Use **GPPXL3** to insert a Pixel 3 element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Pixel 3 structure element depending on the current edit mode.

This structure element defines a two-dimensional rectangular array of pixels that the application writes into the frame buffer of a workstation. The pixel values specify indexes into the workstation's display color table. Only the low order byte of the pixel array is used and preserved by this primitive.

GPPXL3 is identified as GDP 1001.

> **Note:** Not all GDPs are supported on all workstations. Use the Inquire List of Generalized Drawing Primitives (**GPQGD**) subroutine to determine the GDPs supported by an opened workstation. See also the workstation description in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

point — **specified by user, 3 short floating-point numbers (MC)**
> *x*, *y* and *z* coordinates of the upper left corner for start of pixel rectangle.

pack — **specified by user, fullword integer**
> Specifies the packing factor of the pixel color indexes in the input array (8 `BITS/PIXEL`, 16 `BITS/PIXEL`, 32 `BITS/PIXEL`). The interpretation of the following parameters depend on this value. The graPHIGS API uses the least significant 8 bits only.

numrow — **specified by user, fullword integer**
> Number of rows in the input array (>=1).

numcol — **specified by user, fullword integer**
> Number of columns in the input array (>=1).

startrow — **specified by user, fullword integer**
> Row within the array that is the start of the data (>=1).

startcol — **specified by user, fullword integer**
> Column within array that is the start of the data (>=1).

nrow — **specified by user, fullword integer**
> Number of rows within the array to be used for display beginning at the starting position (>=1).

ncol — **specified by user, fullword integer**
> Number of columns within the array to be used for display beginning at the starting position (>=1).

array — **specified by user, array of integers (as defined by the packing factor)**
> A grid of *numrow* by *numcol* color indexes. The array must be in row order.

GPQM3 - Quadrilateral Mesh 3

GPQM3 (*mflags*, *mdata*, *qflags*, *qwidth*, *qdata*, *vxflags*, *vxwidth*, *vxdata*)

Purpose

Use **GPQM3** to insert a Quadrilateral Mesh 3 structure element into the open structure following the element pointer, or to replace the element pointed at by the element pointer with a Quadrilateral Mesh 3 structure element, depending on the current edit mode.

When encountered during structure traversal, this element generates an array of (M minus 1) x (N minus 1) quadrilaterals from a two-dimensional array of M x N vertices. Each quadrilateral is generated by four neighboring points in the vertex array, vertices $v(i, j)$, $v(i + 1, j)$, $v(i + 1, j + 1)$, and $v(i, j + 1)$, where $1<= i<= M$ and $1<= j<= N$. Each quadrilateral is a facet of the primitive. For more information on quardrilaterals, see *The graPHIGS Programming Interface: Understanding Concepts*.

Your application can specify optional data to further control the rendering of this primitive.

- Convexity flag.

  The convexity flag indicates that the application determined the convexity of the quadrilateral mesh primitive. Therefore, the system rendering code does not have to determine the convexity every time the primitive is rendered.

- Normals.

You can specify a geometric normal for each quadrilateral and a reflectance normal for each vertex. The normals are used in the lighting process to produce more realistic effects.

- Colors.

  You can specify color for each quadrilateral and/or each vertex. When rendering this primitive, if the primitive is to be highlighted, then the graPHIGS API uses the highlight color instead. The colors are used in the lighting process to produce more realistic effects.

- Boundary flags.

  The edges of this primitive consist of line segments forming the boundary of each quadrilateral in the mesh. Use boundary flags to identify the boundaries that you want rendered as edges. More boundary flags are specified than actually used, but the graPHIGS API ignores the unused boundary flags. If there are no boundary flags specified, then all boundaries are rendered as edges. If the edge flag is set to `2=ON` and the line type is *not* set to `1=SOLID_LINE` then the results are unpredictable due to the potential double drawing of some edges on some workstations.

- Transparency coefficients.

  You can specify a transparency coefficient per vertex. The graPHIGS API uses these values when producing transparency effects for the rendered primitive.

- Vertex morphing vectors.

  You can supply vertex morphing vectors per vertex. The graPHIGS API combines these vectors with the vertices and vertex morphing scale factors (**GPVMF**)to create new vertex coordinate values for the rendered primitive.

- Data mapping data.

  You can specify data mapping data per vertex. The graPHIGS API uses these values to determine the colors of the rendered primitive.

- Data morphing vectors.

  You can specify data morphing vectors per vertex. The graPHIGS API combines these vectors with the data morphing scale factors (**GPDMF**)and (**GPBDMF**)and the vertex data mapping values to create new data mapping data values for the rendered primitive.

See *The graPHIGS Programming Interface: Understanding Concepts* for a more complete explanation of how the graPHIGS API uses the various optional data values.

> **Note: *This note applies ONLY to applications which will be run on the High Performance 3D Color Graphics Processor (8 or 24 bit).*** Use of any optional data other than the convexity flag, vertex normals, quadrilateral normals, quadrilateral colors, vertex colors, and boundary flags may cause unpredictable results (including locking the display) on this graphics processor. If only the High Performance 3D Color Graphics Processor is used, you should include only the supported optional data values. If your application must support multiple graphics processors INCLUDING this particular processor, the Inquire Workstation Description (**GPQWDT**) subroutine must be used to determine the functions that each workstation supports. See also the workstation description in *The graPHIGS Programming Interface: Technical Reference* for the High Performance 3D Color Graphics Processor.

When the vertices of a quadrilateral are not coplanar, then the method of rendering the quadrilateral is workstation dependent.

During structure traversal, the graPHIGS API ignores quadrilateral meshes with less than two vertices in either direction, i.e., there is no visual effect.

Polygon attributes are applied to this primitive.

GPQM3 is identified as GDP 1031.

Note: Not all GDPs are supported on all workstations. Use the Inquire List of Generalized Drawing Primitives (**GPQGD**) subroutine to determine the GDPs supported by an opened workstation. See also the workstation description in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

mflags — **specified by user, fullword integer**
>   Shows what optional data is specified for the primitive. The value specified should be the sum of the following values based on the fields that are included in the *mdata* parameter.
>
>   **Value   Corresponding Field**
>
>   **0**   Dimensions of vertex array
>
>   **2**   Convexity flag is specified.
>
>   **4**   Count of vertex morphing vectors is specified.
>
>   **8**   Count of data mapping data is specified.
>
>   **16**   Count of data morphing vectors is specified.

mdata — **specified by user, array of primitive data**
>   Contains specific information about the entire primitive. The presence of optional fields is determined by the value of the *mflags* parameter. The fields must be specified in the order defined below and no space is allowed between those that are present.
>
>   **Dimensions of vertex array — 2 fullword integers (>=0)**
>>   The dimensions of the vertex array. The first value (*row_dim*) defines the number of vertices in a row of the array. The second value (*col_dim*) defines the number of vertices in a column of the array. The number of quadrilaterals generated in each dimension is one less than its corresponding vertex array dimension. This field is required.
>
>   **Convexity flag — Fullword integer**
>>   This data indicates that your application determined the convexity of the mesh (0=CONCAVE, 1=CONVEX). If any individual quadrilateral is concave, then set the flag to 0=CONCAVE. Set the flag to 1=CONVEX only if all the quadrilaterals are convex. This allows the workstation to optimize processing of the primitive. This field is optional.
>
>   **Vertex Morphing Vector Count — fullword integer (>=0)**
>>   The number of vertex morphing vectors specified at each vertex. The number of fullwords of vertex morphing vector data added to the other fullwords of vertex data specified per vertex cannot exceed 255 fullwords. This field is optional.
>
>   **Data Mapping Data Count — fullword integer (>=0)**
>>   The number of data mapping values specified at each vertex. The number of data mapping values added to the other fullwords of vertex data specified per vertex cannot exceed 255 fullwords. This field is optional.
>
>   **Data Morphing Vector Count — fullword integer (>=0)**
>>   The number of data morphing vectors specified at each vertex. The number of fullwords of data morphing vector data added to the other fullwords of vertex data specified per vertex cannot exceed 255 fullwords. This field is optional.

qflags — **specified by user, fullword integer**
>   Shows what optional data is specified for each quadrilateral. The value specified should be the sum of the following values based on the fields that are included in the *qdata* parameter.
>
>   **Value   Corresponding Field**
>
>   **0**   Null, *qdata* is not referenced.

1   Geometric normals.

2   Color.

qwidth — **specified by user, fullword integer (>=0)**
>Number of words between subsequent entries of the *qdata* parameter array. The minimum value for this parameter is dependent on the optional data that is specified.

qdata — **specified by user, array of per quadrilateral data**
>Contains specific information about each quadrilateral in the primitive. The length of this array is (row_dim minus 1) times (col_dim minus 1) where *row_dim* and *col_dim* are the vertex array dimensions as defined in *mdata*. The entries of this array are stored in row major order. The presence of optional fields is determined by the value of the *qflags* parameter. The fields must be specified in the order defined below and no space is allowed between those that are present.

>**Geometric normal — 3 short floating-point numbers (MC)**
>>Geometric normal to be used in processing this quadrilateral. This field is optional.

>**Color — 3 short floating-point numbers (0.0<=component<=1.0)**
>>The three components of a color in the current color model as contained in the graPHIGS API state list. This field is optional.

vxflags — **specified by user, fullword integer**
>Shows what optional data is specified for each vertex. The value specified should be the sum of the following values based on the fields that are specified in the *vxdata* parameter.

>**Value Meaning**

>**0**   Vertex coordinates are specified.

>**1**   Vertex normals are specified.

>**2**   Vertex colors are specified.

>**4**   Boundary flags are specified.

>**8**   Transparency coefficient is specified.

>**16**   Vertex morphing vectors are specified.

>**32**   Data mapping data is specified.

>**64**   Data morphing vectors are specified (valid only if date mapping data is specified also).

vxwidth — **specified by user, fullword integer (>=3)**
>Number of words between subsequent data entries of the *vxdata* parameter array. The minimum value for this parameter depends on the optional data that is specified.

vxdata — **specified by user, array of vertex data**
>Contains specific information about each vertex in the primitive. The length of the array is *row_dim* [default] *col_dim*, where *row_dim* and *col_dim* are the dimensions of the vertex array as specified in the *mdata* parameter. The entries are stored in row major order. The presence of optional fields is determined by the value of the *vxflags* parameter. The fields must be specified in the order defined below and no space is allowed between those that are present.

>**Coordinates — 3 short floating-point numbers (MC)**
>>*x*, *y*, and *z* coordinates of a vertex. This field is required.

>**Normal — 3 short floating-point numbers (MC)**
>>The three components of a vector that is to be used as the normal of the quadrilateral at the corresponding vertex. This field is optional.

Color — 3 short floating-point numbers (0.0<=component<=1.0)
> The three components of a color in the current color model as contained in the graPHIGS API state list. This field is optional.

Boundary flags — 2 fullword integers
> Specifies whether the corresponding boundary is to be treated as an edge of the quadrilateral (`1=NOT_AN_EDGE`, `2=IS_AN_EDGE`). These flags allow control over which parts of the quadrilateral's boundary are to be treated as edges. The edge attributes are only applied to boundary segments that have a boundary flag set to a value of `2=IS_AN_EDGE`.
>
> Each vertex $v(i, j)$ has two boundary flags which specify whether the graPHIGS API draws the boundary from the specified vertex to an adjacent vertex. The first boundary flag applies to the boundary from vertex $v(i, j)$ to vertex $v(i + 1, j)$ and the second boundary flag applies to the boundary from vertex $v(i, j)$ to vertex $v(i, j + 1)$, where $1<= i<= col\_dim$ and $1<= j<= row\_dim$. There are more vertices than boundary flags, but the graPHIGS API ignores the unused boundary flags. This field is optional.

Transparency Coefficient — short floating-point number (0.0 <= transparency coefficient <=1.0) The transparency coefficient value used when performing transparency processing. A value of 0.0 is fully opaque; a value of 1.0 is fully transparent. This field is optional.

Vertex Morphing Vectors — array of short floating-point numbers
> The vertex morphing vectors dx_1, dy_1, dz_1, dx_2, dy_2, dz_2, ..., dx_n, dy_n, dz_n. The number, n, of vectors in this array is specified in the *pdata* parameter as the vertex morphing vector count. The array must be the same length for every vertex. This field is optional.

Data Mapping Data — array of short floating-point numbers
> The data mapping data values x_1, x_2, x_3, ..., x_n. The number, n, of values in this array is specified in the *pdata* parameter as the data mapping data count. The array must be the same length for every vertex. This field is optional.

Data Morphing Vectors — array of short floating-point numbers
> The data morphing vectors d_1 1, d_1 2, d_1 3, ..., d_1 n, d_2 1, d_2 2, d_2 3, ..., d_2 n, ..., d_{m1}, d_{m2}, d_{m3}, ..., d_{mn}
>
> The data morphing vectors d_{11}, d_{12}, d_{13}, ..., d_{1n}, d_{21}, d_{22}, d_{23}, ..., d_{2n}, ..., d_{m1}, d_{m2}, d_{m3}, ..., d_{mn}. The number, n, is specified in the *pdata* parameter as the data mapping data count, and the number, m is specified in the *pdata* parameter as the data morphing vector count. The array must be the same length for every vertex. This field is optional.

GPSPH - Polysphere

GPSPH (*nsphere, pflags, pdata, width, spherelist*)

Purpose

Use **GPSPH** to insert a Polysphere structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Polysphere structure element depending on the current edit mode.

When encountered during structure traversal, this element generates a sphere or a sequence of spheres each defined by a center point and a radius in Modelling Coordinates (MC). Each sphere is subject to all transformations and clipping.

All polygon interior and surface attributes are applied to this primitive.

Since the sphere has no defined boundary or edge, edge attributes do not apply to this primitive (i.e., 1=HOLLOW and 5=EMPTY have no visual effect) Highlight color and pick echo for 1=HOLLOW and 5=EMPTY which normally are applied to edges, are applied in a workstation dependent manner (i.e., highlight color and pick echo may be applied to tessellation lines).

GPSPH is identified as GDP 1046.

> **Note:** Not all GDPs are supported on all workstations. Use the Inquire List of Generalized Drawing Primitives (**GPQGD**) subroutine to determine the GDPs supported by an opened workstation. See the workstation description in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

nsphere **— specified by user, fullword integer**
    Number of spheres to be generated (>=0).

pflags **— specified by user, fullword integer**
    Indicates what optional data is specified for this primitive. (There is no optional data currently defined. This field must be set to zero).

pdata — **specified by user, array of primitive data**

Contains specific information about the primitive. The presence of optional fields is determined by the value of the *pflags* parameter. (Since there is no optional data currently defined, this field must be set to zero).

width — **specified by user, fullword integer**

Number of fullwords between subsequent *x* values (>=4).

spherelist — **specified by user, array of short floating point numbers (MC)**

Array of floating point numbers defining the sphere. The number of arrays is equal to the specified number of spheres. Each array contains:

point   3 short floating point numbers (MC)

x, *y* and *z* coordinates of the center of a sphere.

radius a short floating point number (MC)

Radius of the sphere (>=0)

RCP code

201346817 (X'0C004F01')

GPTNBS - Trimmed Non-Uniform B-Spline Surface

> **GPTNBS (*uorder*, *vorder*, *unum*, *vnum*, *uknots*, *vknots*, *tflag*, *utess*, *vtess*, *cflags*, *cwidth*, *ctlpts*, *ncontour*, *ncurve*, *curveinfo*, *tknot*, *ttess*, *cdwidth*, *cddata*)**

Purpose

Use **GPTNBS** to insert a Trimmed Non-Uniform B-Spline Surface structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Trimmed Non-Uniform B-Spline Surface structure element depending on the current edit mode.

At structure traversal time, a non-uniform parametric surface of the specified *uorder* and *vorder* are generated using the specified control points. Only the region of the surface which is bounded by an odd number of trimming curves is rendered.

This primitive generates no output if any of the following are true:
- The requested orders for the basis functions of the surface or trimming curves are not supported by the workstation.
- No trimming curves are specified.

The trimming curves *must* adhere to the following rules; otherwise, the results are unpredictable:
- Each loop must be explicitly closed.
- Curves cannot go outside the parameter range of the surface.
- The trimming curves within a loop must be connected in a head to tail fashion. They may not be randomly specified. The end of one curve must coincide with the beginning of the next curve.
- The trimming curves may not cross other trimming curves in the same or different loop.

The trimming curves have the following *optional* capability:
- A mix of rational and non-rational curves can be used on the same surface.
- The trimming curves can form multiple closed loops.

- Each curve is parameterized independently.

Polygon and surface attributes are applied to this primitive.

GPTNBS is identified as GDP 1036.

> **Note:** Not all GDPs are supported on all workstations. Use the Inquire List of Generalized Drawing Primitives (**GPQGD**) subroutine to determine the GDPs supported by an opened workstation. See also the workstation description in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

uorder **— specified by user, fullword integer**
> Order of the basis functions for the *u* parameter (>=2).

vorder **— specified by user, fullword integer**
> Order of the basis functions for the *v* parameter (>=2).

unum **— specified by user, fullword integer**
> Number of surface control points for the *u* direction (>=uorder).

vnum **— specified by user, fullword integer**
> Number of surface control points for the *v* direction (>=vorder).

uknots **— specified by user, array of short floating-point numbers**
> Knot values for the *u* parameter. The length of this array must be *uorder*+ *unum*. This parameter must be a non-decreasing knot value sequence.

vknots **— specified by user, array of short floating-point numbers**
> Knot values for the *v* parameter. The length of this array must be *vorder*+ *vnum* This parameter must be a non-decreasing knot value sequence.

tflag **— specified by user, fullword integer**
> Surface tessellation quality value flag. This parameter shows whether the tessellation quality values are specified or not.

> | Value | Meaning |
> |---|---|
> | **0** | Not specified. |
> | **1** | Specified. |

utess **— specified by user, array of short floating-point numbers**
> Tessellation quality values for the *u* direction. When the *tflag* parameter is set to a value of one, this parameter must contain *unum*- *uorder*+1 quality values. These values are used in conjunction with Surface Approximation Criteria method 8 to control the number of sub-divisions made in the *u* direction. The number of sub-divisions that are performed for a patch is approximately the product of this value and the Surface Approximation Criteria control value (*u*) in the traversal state list.

vtess **— specified by user, array of short floating-point numbers**
> Tessellation quality values for the *v* direction. When the *tflag* parameter is set to a value of one, this parameter must contain *vnum*- *vorder*+1 quality values. These values are used in conjunction with Surface Approximation Criteria method 8 to control the number of sub-divisions made in the *v* direction. The number of sub-divisions that are performed for a patch is approximately the product of this value and the Surface Approximation Criteria control value (*v*) in the traversal state list.

cflags **— specified by user, fullword integer**
> Control point optional data flags. This parameter shows what data is specified for each control point. The value specified should be the sum of the following values based on the fields that are specified in the *ctlpts* parameter.

Value   Meaning

0   Control point coordinates.

1   Weights are specified with each control point. This produces the rational form of the Non-Uniform B-Spline Surface.

cwidth **— specified by user, fullword integer**
Number of words between subsequent entries of control points array *ctlpts*.

ctlpts **— specified by user, array of short floating-point numbers.**
Grid of control points. The control points are stored by row where a row is considered to be the direction associated with the *u* parameter. For example, the set of control points

```
                  ^
                  | m   n   o   p
                  |
                  | i   j   k   l
    Increasing v  |
                  | e   f   g   h
                  |
                  | a   b   c   d
                  --------------->
                      Increasing u
```

would be stored in the order a, b, c, d, e, f, g, h, i, j, k, l, m, n, o, and p. The *cwidth* parameter must be at least three. If *cflags* specifies that weights are included with each control point, the *cwidth* parameter must be at least four. Each weight *W* must be greater than zero when specified.

> **Note:** When *W* is specified, the control points are not in homogeneous form (i.e.,*XW*, *YW*, *ZW*, *W*). They are specified after division by *W* or (*X*, *Y*, *Z*, *W*).

ncontour **— specified by user, fullword integer**
Number of contours to be generated (>=0).

ncurve **— specified by user, array of fullword integers**
Number of curves in each contour. Each entry must be greater than or equal to one. The length of this array is defined by the value of the *ncontour* parameter.

curveinfo **— specified by user, array of curve data**
Array containing information about each curve. Each entry of this parameter must have the following fields in this order:

Type of Curve — fullword integer
This field must contain

3 -   Non-Uniform B-Spline curve

Options — fullword integer
This parameter specifies various options of the curve. Each option is specified by a bit in this word and the following bits are currently defined.

Bit   Meaning

0-28   Reserved. Must be set to zero.

29   Tessellation quality flag.

If set, a tessellation quality value for each span of this curve is specified in the *ttess* parameter.

30   Weight flag.

If set, the curve is rational and the weight is specified for each control point in the *cddata* parameter.

31 Boundary flag.

If set, the curve is treated as an edge of the composite fill area.

Order — fullword integer
Order of the curve (>=2).

Number of Data — fullword integer
Number of entries of the *cddata* parameter used to define the curve. This parameter corresponds to the *npoint* parameter of the Non-Uniform B-Spline Curve 2. The specified number's entries of the *cddata* parameter are used as its *ctlpts* parameter.

Start — short floating-point number
The parameter value representing the start point of the curve.

End — short floating-point number
The parameter value representing the end point of the curve.

tknot **— specified by user, array of short floating-point numbers**
Array of knot values for the *t* direction of the curve. The sequence of each list in this array is assumed to match the order of the curve definitions in *curveinfo*. The length of each list equals the *order* + number of data for the curve.

ttess **— specified by user, array of short floating-point numbers**
Array of tessellation quality values. This array must contain one list for each Non-Uniform B-Spline curve with a tessellation quality flag set to a value of one (specified). For other curves, this array is not referenced. The sequence of each list in this array is assumed to match the order of the curve definitions in *curveinfo*. The length of each list equals the number of data - *order* + 1 of the curve.

cdwidth **— specified by user, fullword integer.**
Specifies the number of fullwords between each entry of the array in *cddata*. If there is any rational curve in the *curveinfo* parameter, this parameter must be at least three. Otherwise, it must be larger than or equal to two.

cddata **— specified by user, array of short floating-point numbers**
This array must contain one list for each curve. The sequence of each list in this array is assumed to match the order of the curve definitions in *curveinfo*. The length of each list equals the number of data field specified in the *curveinfo* parameter.

For each entry, the following fields are defined and the fields must be specified in this order without any gap.

U, V components —
2 short floating-point numbers

weight —
short floating-point number

GPTS3 - Triangle Strip 3

GPTS3 (*pflags*, *pdata*, *tflags*, *twidth*, *tdata*, *vxflags*, *vxwidth*, *vxdata*)

Purpose

Use **GPTS3** to insert a Triangle Strip 3 structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Triangle Strip 3 structure element depending on the current edit mode.

When encountered during structure traversal, this element generates n - 2 triangles from *n* vertices. Each triangle is generated by vertices k, k + 1, k + 2. Your application can specify optional data to further control the rendering of this primitive. The optional data consists of:

• Normals.

  You can specify a geometric normal for each triangle and/or a normal for each vertex. The normals are used in the lighting process to produce more realistic effects.

• Vertex colors.

  You can specify color for each vertex. If the current color source attribute indicates using the color defined in the primitive, and the primitive is not to be highlighted, then the graPHIGS API uses the specified color. The colors are used in the lighting process to produce more realistic effects.

• Boundary flags.

  The edges of this primitive consist of the line segments forming the boundary of each triangle in the strip. You may specify boundary flags to identify the boundaries that are to be rendered as edges. (More boundary flags are specified than are actually used; the unused boundary flags are ignored.). Whether the edges between triangles are drawn once or twice is workstation dependent.

• Transparency coefficients.

  You can specify a transparency coefficient per vertex. The graPHIGS API uses these values when producing transparency effects for the rendered primitive.

• Vertex morphing vectors.

  You can supply vertex morphing vectors per vertex. The graPHIGS API combines these vectors with the vertices and vertex morphing scale factors (**GPVMF**) to create new vertex coordinate values for the rendered primitive.

- Data mapping data.

  You can specify data mapping data per vertex. The graPHIGS API uses these values to determine the colors of the rendered primitive.

- Data morphing vectors.

  You can specify data morphing vectors per vertex. The graPHIGS API combines these vectors with the data morphing scale factors (**GPDMF**) and (**GPBDMF**) and the vertex data mapping values to create new data mapping data values for the rendered primitive.

See *The graPHIGS Programming Interface: Understanding Concepts* for a more complete explanation of how the graPHIGS API uses the various optional data values.

> **Note: *This note applies ONLY to applications which will be run on the High Performance 3D Color Graphics Processor (8 or 24 bit)*.** Use of any optional data other than the vertex normals, triangle normals, vertex colors, and boundary flags may cause unpredictable results (including locking the display) on this graphics processor. If only the High Performance 3D Color Graphics Processor is used, you should include only the supported optional data values. If your application must support multiple graphics processors INCLUDING this particular processor, the Inquire Workstation Description (**GPQWDT**) subroutine must be used to determine the functions that each workstation supports. See also the workstation description in *The graPHIGS Programming Interface: Technical Reference* for the High Performance 3D Color Graphics Processor.

When rendering this primitive, if the current edge flag attribute is set to `2=ON` and the current line type is *not* set to `1=SOLID_LINE`, then the results are unpredictable due to the potential double drawing of some edges on some workstations.

The graPHIGS API ignores triangle strips with less than three vertices.

Polygon attributes are applied to this primitive.

GPTS3 is identified as GDP 1029.

> **Note:** Not all GDPs are supported on all workstations. Use the Inquire List of Generalized Drawing Primitives (**GPQGD**) subroutine to determine the GDPs supported by an opened workstation. See also the workstation description in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

pflags — **specified by user, fullword integer**
> Shows what optional data is specified for the primitive. The value specified should be the sum of the following values based on the fields that are included in the *pdata* parameter.

> | Value | Corresponding Field. |
> |-------|----------------------|
> | **0** | Number of vertices. |
> | **4** | Count of vertex morphing vectors is specified. |
> | **8** | Count of data mapping data is specified. |
> | **16** | Count of data morphing vectors is specified. |

pdata — **specified by user, array of primitive data**
> Contains specific information about the entire primitive. The presence of optional fields is determined by the value of the *pflags* parameter. The fields must be specified in the order defined below and no space is allowed between those that are present.

> **Number of Vertices — fullword integer (>=0)**
> > Number of vertices in the triangle strip. This field is required.

Vertex Morphing Vector Count — fullword integer (>=0)
>   The number of vertex morphing vectors specified at each vertex. The number of fullwords of vertex morphing vector data added to the other fullwords of vertex data specified per vertex cannot exceed 255 fullwords. This field is optional.

Data Mapping Data Count — fullword integer (>=0)
>   The number of data mapping values specified at each vertex. The number of data mapping values added to the other fullwords of vertex data specified per vertex cannot exceed 255 fullwords. This field is optional.

Data Morphing Vector Count — fullword integer (>=0)
>   The number of data morphing vectors specified at each vertex. The number of fullwords of data morphing vector data added to the other fullwords of vertex data specified per vertex cannot exceed 255 fullwords. This field is optional.

tflags — **specified by user, fullword integer**
>   Shows what optional data is specified for each triangle. The value specified should be the sum of the following values based on the fields that are included in the *tdata* parameter.

Value	Corresponding Field
0	Null, *tdata* is not referenced.
1	Geometric Normals.

twidth — **specified by user, fullword integer**
>   Number of words between subsequent entries of the *tdata* parameter array (>=0).

tdata — **specified by user, array of per triangle data**
>   Contains specific information about each triangle in the primitive. The length of this array is defined by the contents of the `number of vertices`-2. The presence of optional fields is determined by the value of the *tflags* parameter. The fields must be specified in the order defined below and no space is allowed between those that are present.

Geometric Normal — 3 short floating-point numbers (MC)
>   Geometric normal to be used in processing the triangle. This field is optional.

vxflags — **specified by user, fullword integer**
>   Shows what optional data is specified for each vertex. The value specified should be the sum of the following values based on the fields that are specified in the *vxdata* parameter.

Value	Meaning
0	Vertex coordinates are specified.
1	Vertex normals are specified.
2	Vertex colors are specified.
4	Boundary flags are specified.
8	Transparency coefficient is specified.
16	Vertex morphing vectors are specified.
32	Data mapping data is specified.
64	Data morphing vectors are specified (valid only if date mapping data is specified also).

vxwidth — **specified by user, fullword integer**
　　　Number of words between subsequent entries of the *vxdata* parameter array (>=3).

vxdata — **specified by user, array of vertex data**
　　　Contains specific information about each vertex in the primitive. The length of this array is equal to `number of vertices` field in the *pdata* parameter. The presence of optional fields is determined by the value of the *vxflags* parameter. The fields must be specified in the order defined below and no space is allowed between those that are present.

Coordinates — 3 short floating-point numbers (MC)
　　　x, y, and *z* coordinates of a vertex. This field is required.

Normal — 3 short floating-point numbers (MC)
　　　The three components of a vector that is to be used as the normal of the polygon at the corresponding vertex. This field is optional.

Color — 3 short floating-point numbers
　　　The three components of a color in the current color model as contained in the graPHIGS API state list. This field is optional.

Boundary Flags — 2 fullword integers
　　　Specifies whether the corresponding boundary is to be treated as an edge of the polygon (`1=NOT_AN_EDGE`, `2=IS_AN_EDGE`). The edge attributes are only applied to boundary segments that have a boundary flag set to a value of `2=IS_AN_EDGE`.

　　　Each vertex *v(i)* has two boundary flags which specify whether the boundary from the specified vertex to an adjacent vertex is to be drawn as an edge. The first boundary flag applies to the boundary from vertex *v(i)* to vertex *v(i+1)* and the second boundary flag applies to the boundary from vertex *v(i)* to vertex *v(i+2)*, where *1<=i<=number_of_vertices*. As there are more boundary flags than edges, unused boundary flags are ignored. This field is optional.

Transparency Coefficient — short floating-point number (0.0 <= transparency coefficient <=1.0)
　　　The transparency coefficient value used when performing transparency processing. A value of 0.0 is fully opaque; a value of 1.0 is fully transparent. This field is optional.

Vertex Morphing Vectors — array of short floating-point numbers.
　　　The vertex morphing vectors dx_1, dy_1, dz_1, dx_2, dy_2, dz_2, ..., dx_n, dy_n, dz_n. The number, *n*, of vectors in this array is specified in the *pdata* parameter as the vertex morphing vector count. The array must be the same length for every vertex. This field is optional.

Data Mapping Data — array of short floating-point numbers.
　　　The data mapping data values x_1, x_2, x_3, ..., x_n. The number, *n*, of values in this array is specified in the *pdata* parameter as the data mapping data count. The array must be the same length for every vertex. This field is optional.

Data Morphing Vectors — array of short floating-point numbers.
　　　The data morphing vectors d_{11}, d_{12}, d_{13}, ..., d_{1n}, d_{21}, d_{22}, d_{23}, ..., d_{2n}, ..., d_{m1}, d_{m2}, d_{m3}, ..., d_{mn}.

　　　The number, *n*, is specified in the *pdata* parameter as the data mapping data count, and the number, *m* is specified in the *pdata* parameter as the data morphing vector count. The array must be the same length for every vertex. This field is optional.

GPTX2 - Geometric Text 2

GPTX2 (*point*, *length*, *text*)

Purpose

Use **GPTX2** to insert a two-dimensional, geometric text element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Geometric Text 2 structure element depending on the current edit mode.

This structure element specifies a string of geometric text that the graPHIGS API draws at the specified location in the *x*, *y* plane.

When you create this structure element, the current Text Character Set value in the graPHIGS API State List is bound to this character string.

Parameters

point **— specified by user, 2 short floating-point numbers (MC)**
> *x* and *y* coordinates of the text position.

length **— specified by user, fullword integer**
> Length of text string in bytes (>=0).

text **— specified by user, variable length character string**
> Text to be displayed.

GPTX3 - Geometric Text 3

GPTX3 (*point, length, text, refv1, refv2*)

Purpose

Use **GPTX3** to insert a three-dimensional, geometric text element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Geometric Text 3 structure element depending on the current edit mode.

This structure element specifies a string of geometric text that the graPHIGS API draws on the plane defined by the specified text position and reference vectors.

When you create this structure element, the current Text Character Set value in the graPHIGS API State List is bound to this character string.

Two vectors definitions orient a local coordinate system, within which the text is positioned. The two reference vectors and the text position define the plane in which the text is drawn. The first vector defines the x-axis of the local coordinate system. The second reference vector defines the half plane of the text in which the positive y-axis lies. The directions specified by Character Up Vector and Text Path attributes are relative to this coordinate system.

Parameters

point — **specified by user, 3 short floating-point numbers (MC)**
    x, *y*, and *z* coordinates of the text position. This position serves as the origin of the local coordinate system within which three-dimensional text is defined.

length — **specified by user, fullword integer**
    Length of text string in bytes (>=0).

text — **specified by user, variable length character string**
    Text to be displayed.

refv1 — **specified by user, 3 short floating-point numbers (MC)**
    Directional components of the first text reference vector.

refv2 — **specified by user, 3 short floating-point numbers (MC)**
    Directional components of the second reference vector.

Chapter 4. Attribute Structure Elements

Attribute values describe the appearance of output primitives, including size, shape, style, and color.

This group of subroutines creates structure elements and requires that the structure state is Structure Open (STOP). When the graPHIGS API encounters the elements in this section at traversal time, it modifies the current traversal time registers.

Your application can specify some attribute values directly through a structure element or indirectly by using an index to a bundle table in the Workstation State List (WSL). During structure traversal, the current Attribute Source Flag (ASF) setting determines whether the graPHIGS API draws a primitive using an individual or bundled value of an attribute. For more information about attributes, see *The graPHIGS Programming Interface: Understanding Concepts (POWER-based System Only)*.

For attribute values supported on a specific workstation, use the appropriate Inquiry programming subroutines or see *The graPHIGS Programming Interface: Technical Reference (POWER-based System Only)*.

GPAAL - Set Annotation Alignment

GPAAL (*horiz*, *vert*)

Purpose

Use **GPAAL** to insert a Set Annotation Alignment structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Annotation Alignment structure element depending on the current edit mode.

This structure element specifies the alignment the graPHIGS API uses at structure traversal time to render all subsequent annotation text primitives.

The alignment values affect the position of the annotation text extent rectangle in relation to the text position.

The traversal default for annotation alignment is 1=NORMAL. If the specified alignment values are not within the allowable range, then the graPHIGS API uses a default alignment of 1=NORMAL for both horizontal and vertical.

For more information concerning annotation text and annotation text attributes, see *The graPHIGS Programming Interface: Understanding Concepts (POWER-based System Only)*.

Parameters

horiz — **specified by user, fullword integer**
Horizontal alignment (1=NORMAL, 2=LEFT_ALIGN, 3=CENTER, 4=RIGHT_ALIGN)

vert — **specified by user, fullword integer**
Vertical alignment (1=NORMAL, 2=TOP, 3=CAP, 4=HALF, 5=BASE, 6=BOTTOM)

Error Codes

5	FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)
309	TEXT ALIGNMENT COMPONENT IS INVALID

113

GPADCN - Add Class Name to Set

GPADCN (*number*, *names*)

Purpose

Use **GPADCN** to insert an Add Class Name to Set structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with an Add Class Name to Set structure element depending on the current edit mode.

During structure traversal, this structure element adds the specified class names to the current class set. The traversal default is a null name set.

Class names let an application control the eligibility of a primitive for pickability (detectability), highlighting, and invisibility by associating the primitive with a class set.

When the graPHIGS API encounters a primitive during structure traversal, the primitive belongs to the classes contained in the current class set. If the workstation does not support a specified name, then the graPHIGS API ignores the name and the name has no affect on the primitive.

Also use class names to create inclusion and exclusion filters for the specified workstation. The graPHIGS API uses these filters in conjunction with the class set traversal state to determine if pickability, highlighting, and visibility apply. The filters act independently of each other. During structure traversal, the graPHIGS API compares the current class set to the current filters.

For a complete discussion of class names and filters, see *The graPHIGS Programming Interface: Understanding Concepts (POWER-based System Only)*.

Parameters

number — **specified by user, fullword integer**
       Number of class names to add to the class set (>=0)

names — **specified by user, array of fullword integers**
       Array of class names to add to the class set (class names must be >=0)

Error Codes

5	FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)
320	CLASS NAME VALUE IS INVALID
530	NUMBER OF CLASS NAMES < ZERO

GPAH - Set Annotation Height

> **GPAH (*height*)**

Purpose

Use **GPAH** to insert a Set Annotation Height structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Annotation Height structure element depending on the current edit mode.

The application specifies the annotation text character height with respect to the annotation text local coordinate system; that is, a two-dimensional coordinate system parallel to the NPC (Normalized Projection Coordinates) *x*, *y* plane. The graPHIGS API multiplies the specified height by the scale factor of the current workstation transformation, and then maps the result to the closest available height on the workstation.

The current annotation character height entry in the graPHIGS API traversal state list is also set by the Set Annotation Height Scale Factor (**GPAHSC**) structure element. As a result, the traversal default annotation height corresponds to a default annotation height scale factor of 1.0.

For more information concerning annotation text and annotation text attributes, see *The graPHIGS Programming Interface: Understanding Concepts (POWER-based System Only)*.

Parameters

height — **specified by user, short floating-point number (NPC)**
Annotation text character height (>0)

Error Codes

5	FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)
78	CHARACTER HEIGHT VALUE <= ZERO

Related Subroutines

GPAHSC	Set Annotation Height Scale Factor
GPQXAF	Inquire Extended Annotation Font Characteristics

RCP code

201328660 (X'0C000814')

GPAHSC - Set Annotation Height Scale Factor

GPAHSC (*factor*)

Purpose

Use **GPAHSC** to insert a Set Annotation Height Scale Factor structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Annotation Height Scale Factor structure element depending on the current edit mode.

The specified annotation height scale factor specifies a ratio of the annotation character height to the workstation's nominal character height. Because the current annotation text character height in the graPHIGS API traversal state list is expressed in Device Coordinates (DC), the graPHIGS API multiplies the specified value by the nominal character height and sets the specified value to the entry.

The current annotation character height entry in the graPHIGS API traversal state list is also set by the Set Annotation Height (**GPAH**) structure element.

The traversal default value for annotation height scale factor is 1.0.

For more information concerning annotation text and annotation text attributes, see *The graPHIGS Programming Interface: Understanding Concepts (POWER-based System Only)*.

Parameters

factor — **specified by user, short floating-point number**
This attribute specifies the height scale factor. This factor is multiplied by the workstation dependent nominal annotation text character height.

Error Codes

5	FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)

Related Subroutines

GPAH	Set Annotation Height
GPQXAF	Inquire Extended Annotation Font Characteristics

RCP code

201328655 (X'0C00080F')

GPAID - Set Antialiasing Identifier

GPAID (*antid*)

Purpose

Use **GPAID** to insert a Set Antialiasing Identifier structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Antialiasing Identifier structure element depending on the current edit mode.

During structure traversal, the graPHIGS API sets the antialiasing identifier entry of graPHIGS API traversal state list to the value specified by the parameter. To create subsequent output primitives, use this value. This value supplies antialiasing information to the workstation.

The traversal default for the antialiasing identifier is `1=NONE`.

If the workstation does not support the specified antialiasing identifier, then the antialiasing identifier defaults to `1=NONE`.

Parameters

antid — **specified by user, fullword integer**
 Antialiasing identifier (`1=NONE,` `2=PERFORM`)

Error Codes

5	FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)
252	ANTIALIASING IDENTIFIER IS INVALID

GPAPT - Set Annotation Path

GPAPT (*path*)

Purpose

Use **GPAPT** to insert a Set Annotation Path structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Annotation Path structure element depending on the current edit mode.

This structure element specifies the writing direction of characters in a text string relative to the Annotation Up vector. At structure traversal time, the graPHIGS API uses this path value to render all subsequent annotation text primitives.

The traversal default for annotation path is `1=RIGHT`.

If the workstation does not support the specified path value, then the annotation path value defaults to `1=RIGHT`.

For more information concerning annotation text and annotation text attributes, see *The graPHIGS Programming Interface: Understanding Concepts*.

Parameters

path — **specified by user, fullword integer**
> Specifies the path for annotation text primitives (`1=RIGHT, 2=LEFT, 3=UP, 4=DOWN`).

Error Codes

5	FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)
306	TEXT PATH VALUE IS INVALID

Related Subroutines

GPTXPR	Set Text Precision

RCP code

201328667 (X'0C00081B')

GPAS - Set Annotation Style

GPAS (*style*)

Purpose

Use **GPAS** to insert a Set Annotation Style structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Annotation Style structure element depending on the current edit mode.

During structure traversal, this structure element sets the current annotation style entry in the graPHIGS API traversal state list to the value specified by the annotation style (*style*) parameter to render subsequent annotation text primitives. For annotation style `2=LEAD_LINE`, the current polyline attributes are used to render the lead line.

The traversal default for annotation style is `1=UNCONNECTED`.

If the workstation does not support the specified annotation style, then the annotation style defaults to `1=UNCONNECTED`.

Parameters

style — **specified by user, fullword integer**
> Annotation style (`1=UNCONNECTED, 2=LEAD_LINE`).

Error Codes

5	FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)
82	ANNOTATION STYLE IS INVALID

Related Subroutines

GPANR2	Annotation Text Relative 2
GPANR3	Annotation Text Relative 3

RCP code

201328668 (X'0C00081C')

GPASF - Attribute Source Flag Setting

GPASF (*number*, *id*, *flag*)

Purpose

Use **GPASF** to insert a Set Attribute Source Flag (ASF) structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Attribute Source Flag (ASF) structure element depending on the current edit mode.

At structure traversal time, the current ASF setting determines the `1=BUNDLED` or `2=INDIVIDUAL` attributes that the graPHIGS API uses to draw an output primitive.

The traversal default for all attributes is `2=INDIVIDUAL`.

If any attribute identifier in the list is invalid, then the graPHIGS API ignores that entry. If any attribute source flag is invalid, then it defaults to `2=INDIVIDUAL`.

Parameters

number — **specified by user, fullword integer**
>The number of entries in the lists (>=0).

id — **specified by user, array of fullword integers**
>List of attribute identifiers. Valid values are:

1	=Linewidth scale factor
3	=Polyline color
4	=Marker type
5	=Marker size scale factor
6	=Polymarker color
7	=Text font
8	=Text precision
9	=Character expansion factor

GPAUP - Set Annotation Up Vector

GPAUP (*vector*)

Purpose

Use **GPAUP** to insert a Set Annotation Up Vector structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Annotation Up Vector structure element depending on the current edit mode.

At structure traversal time, this structure element specifies the y-axis direction for characters in a text string that the graPHIGS API uses to render all subsequent annotation text primitives. When rendering annotation text primitives, the graPHIGS API uses the annotation up vector along with a default annotation base vector set at right angles in the clockwise direction to the annotation up vector.

The traversal default value for annotation up vector is 0.0, 1.0, and for annotation base vector the traversal default is 1.0, 0.0.

If the annotation up vector is invalid, then a vector value defaults to a value of 0.0, 1.0, and a base vector value of 1.0, 0.0.

The graPHIGS API normalizes the specified vectors. If the application later inquires the content of this structure element, then the graPHIGS API returns the normalized vector, *not* the original vector specified by this subroutine.

For more information concerning annotation text and annotation text attributes, see *The graPHIGS Programming Interface: Subroutine Reference (POWER-based System Only)*.

Parameters

vector **— specified by user, 2 short floating-point numbers (NPC)**
Directional components of the annotation text character up vector. Magnitude must be greater than zero.

Error Codes

5	FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)
79	CHARACTER UP VECTOR HAS LENGTH ZERO

201328666 (X'0C00081A')

GPBBLF - Set Back Blending Function

GPBBLF (*srcf, destf*)

Purpose

Use **GPBBLF** to insert a Set Back Blending Function structure element into the open structure following the element pointer, or to replace the element pointed at by the element pointer with a Set Back Blending Function structure element, depending upon the current edit mode.

Blending is a method of combining the colors of the primitive being rendered (called the *source*) with previously rendered output (called the *destination*) to create a new color for the destination. The blending function specifies how you combine the source and destination colors. Conceptually:

$$COLOR = (srcf \times COLOR_{src}) + (destf \times COLOR_{dest})$$

where *srcf* and *destf* are the source and destination blending functions respectively.

This element specifies the source blending function (*srcf*) and the destination blending function (*destf*) you use when you blend subsequent primitives with previously rendered output. Blending occurs when the Transparency Processing Mode of the view table entry is 3=BLEND or 4=BLEND_ALL.

The traversal default for *srcf* is 3=SRCBF_SRC_ALPHA and for *destf* is 4=DSTBF_ONE_MINUS_SRC_ALPHA.

This element specifies the methods you use to control the blending calculations performed on back facing portions of subsequent area primitives. The graPHIGS API uses the specified methods if the face distinguish mode (**GPFDMO**) is set to 2=COLOR_SURFACE_PROPERTIES.

The source and destination blending functions are selected by your application using the *srcf* and *destf* parameters for **GPBBLF** as indicated in the following table:

Source function ID	*srcf*	Destination function ID	*destf*
1	0	1	0
2	1	2	1
3	$alpha_{src}$	3	$alpha_{src}$
4	$1 - alpha_{src}$	4	$1 - alpha_{src}$
5	$alpha_{dest}$	5	$alpha_{dest}$
6	$1 - alpha_{dest}$	6	$1 - alpha_{dest}$
7	$R_{dest}, G_{dest}, B_{dest}$, or $alpha_{dest}$	7	$R_{src}, G_{src}, B_{src}$, or $alpha_{src}$
8	$1 - (R_{dest}, G_{dest}, B_{dest}$, or $alpha_{dest})$	8	$1 - (R_{src}, G_{src}, B_{src}$, or $alpha_{src})$
9	$min (alpha_{src}, 1 - alpha_{dest})$		

For example, if *srcf* has the value 2=SRCBF_ONE and *destf* has the value 1=DSTBF_ZERO, then the blending function becomes:

COLOR = (1.0 x COLOR~src~*) + (0.0 x COLOR*~dest~*)* which causes the source color to replace the destination color.

In the table blending coefficients, also called *alpha values* (alpha), are floating-point numbers in the range [0.0,1.0] where 0.0 is fully transparent and 1.0 is fully opaque (opposite of the definition of a transparency coefficient). The source blending coefficient (alpha~src~) is calculated from the source transparency coefficient (*coeff*) as follows:

alpha~src~ = 1.0 - *coeff*

where coeff is in the range [0.0,1.0] and is specified by the Set Back Transparency Coefficient procedure (**GPBTCO**) or by the transparency coefficient of the Set Back Surface Properties subroutine (**GPBSPR**). (These two subroutines set the same transparency coefficient). You can also specify the transparency coefficient as part of the vertex information of certain primitives. Alternately, you can directly supply alpha values and transparency coefficients as part of a texture map. Where available, the alpha buffer provides the destination blending coefficient (alpha~dest~) defined by some of the blending functions. If a blending function is not supported by the workstation, or if a destination blending function is specified on a workstation that does not have alpha buffers, then the element is ignored. Use **GPQWDT** to inquire the transparency facilities of a specified workstation.

A new blending coefficient is calculated from the blending equation and stored with each color (pixel) on those workstations which support alpha buffers. Those workstations which do not support alpha buffers do not support blending functions from the table which include alpha~dest~. The alpha~dest~ value is typically stored as an integer in the range [0,255]. The initial alpha~dest~ value for a view's shield can be specified using the Set Extended View Representation (**GPXVR**).

Parameters

srcf— **specified by user, fullword integer**
> Source blending function (1=SRCBF_ZERO, 2=SRCBF_ONE, 3=SRCBF_SRC_ALPHA, 4=SRCBF_ONE_MINUS_SRC_ALPHA, 5=SRCBF_DST_ALPHA, 6=SRCBF_ONE_MINUS_DST_ALPHA, 7=SRCBF_DST_COLOR, 8=SRCBF_ONE_MINUS_DST_COLOR, 9=SRCBF_MIN_SRC_ALPHA_ONE_MINUS_DST_ALPHA).

destf— **specified by user, fullword integer**
> Destination blending function (1=DSTBF_ZERO, 2=DSTBF_ONE, 3=DSTBF_SRC_ALPHA, 4=DSTBF_ONE_MINUS_SRC_ALPHA, 5=DSTBF_DST_ALPHA, 6=DSTBF_ONE_MINUS_DST_ALPHA, 7=DSTBF_SRC_COLOR, 8=DSTBF_ONE_MINUS_SRC_COLOR).

GPBDFM - Set Back Data Filtering Method

> **GPBDFM (*minfm, magfm, boundu, boundv*)**

Purpose

Use **GPBDFM** to insert a Set Back Data Filtering Method structure element into the open structure following the element pointer, or to replace the element pointed at by the element pointer with a Set Data Filtering Method structure element, depending upon the current edit mode.

This element specifies the back data filtering method that the graPHIGS API uses to perform data mapping on back facing portions of subsequent area primitives.

If the face distinguish mode (**GPFDMO**) is `1=NONE`, then the graPHIGS API uses the current data filtering method for data mapping on the front and back facing portions of area primitives. If the face distinguish mode is `2=COLOR_SURFACE_PROPERTIES`, then the graPHIGS API uses the specified back data filtering method for data mapping on only back facing portions of area primitives. When the data mapping method is `2=SINGLE_VALUE_UNIFORM`, the graPHIGS API ignores the *boundv* parameter.

The traversal default back data filtering methods are:

Minification:	`1=SAMPLE_IN_BASE`
Magnification:	`1=SAMPLE_IN_BASE`
U-dimension:	`1=CLAMP`
V-dimension:	`1=CLAMP`

If any specified value is not supported on the workstation, then the default value is used.

Parameters

minfm **— specified by user, fullword integer**
Minification filtering method (`1=SAMPLE_IN_BASE`, `2=INTERP_IN_BASE`, `3=SAMPLE_IN_SQUARE_MM`, `4=SAMPLE_IN_AND_INTERP_BTWN_SQUARE_MM`, `5=INTERP_IN_SQUARE_MM`, `6=INTERP_IN_AND_BTWN_SQUARE_MM`, `7=SAMPLE_IN_RECT_MM`, `8=SAMPLE_IN_AND_INTERP_BTWN_RECT_MM`, `9=INTERP_IN_RECT_MM`).

magfm **— specified by user, fullword integer**
Magnification filtering method (`1=SAMPLE_IN_BASE`, `2=INTERP_IN_BASE`).

boundu **— specified by user, fullword integer**
U-dimension bounding method (`1=CLAMP`, `2=REPEAT`).

boundv **— specified by user, fullword integer**
V-dimension bounding method (`1=CLAMP`, `2=REPEAT`).

GPBDMI - Set Back Data Mapping Index

GPBDMI (*index*)

Purpose

Use **GPBDMI** to insert a Set Back Data Mapping Index structure element into the open structure following the element pointer, or to replace the element pointed at by the element pointer with a Set Back Data Mapping Index structure element, depending upon the edit mode.

During traversal, the back data mapping index specifies the entry in the data mapping table used to perform data mapping on subsequent primitives that support data mapping.

If the face distinguish mode (**GPFDMO**) is `1=NONE`, then the graPHIGS API uses the current data mapping index for data mapping on the front and back facing portions of area primitives. If the face distinguish mode is `2=COLOR_SURFACE_PROPERTIES`, then the graPHIGS API uses the specified back data mapping index for data mapping on only back facing portions of area primitives.

The data mapping table is zero based. Entry zero always contains a data mapping entry of `1=DM_METHOD_COLOR` Use **GPQWDT** to determine the number of definable data mapping table entries.

The traversal default back data mapping index is zero. If the specified index is not supported on the workstation, then the graPHIGS API uses a default index of zero.

Parameters

index — **specified by user, fullword integer**
Data mapping table index (>=0).

Error Codes

5	FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)
630	DATA MAPPING INDEX < ZERO

GPBDM2 - Set Back Data Matrix 2

> **GPBDM2 (*matrix*)**

Purpose

Use **GPBDM2** to insert a Set Back Data Matrix 2 structure element into the open structure following the element pointer, or to replace the element pointed at by the element pointer with a Set Back Data Matrix 2 structure element, depending upon the current edit mode.

This element specifies the transformation matrix that the graPHIGS API uses to modify the data mapping values on back facing portions of primitives that support data mapping. The specified matrix is used if the face distinguish mode (**GPFDMO**) is `2=COLOR_SURFACE_PROPERTIES`.

The data mapping values are treated as homogeneous points of the form ($u, v,$ 1.0). When used with a data mapping method of `2=SINGLE_VALUE_UNIFORM`, the graPHIGS API sets the v coordinate value to 0.0. Otherwise, the graPHIGS API uses indexed vertex data values for the u and v coordinate values. This point is multiplied by the specified matrix. The resulting values are used to perform the data mapping.

The last column of the matrix must have the values 0.0, 0.0, 1.0.

The traversal default back data matrix is the identity matrix.

Parameters

matrix — **specified by user, 9 short floating-point numbers**
> Back data modification matrix.
>
> The elements of the matrix must be specified as follows:
>
> ```
> |m11  M12  0.0|
> |m21  M22  0.0|  ---> (m11, m12, 0.0, m21, m22, 0.0, m31, m32, 1.0)
> |m31  M32  1.0|
> ```

GPBICD - Set Back Interior Color Direct

> **GPBICD (*color*)**

Purpose

Use **GPBICD** to insert a Set Back Interior Color Direct structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Back Interior Color Direct structure element depending on the current edit mode.

This structure element specifies direct color values. During structure traversal, the graPHIGS API uses these values to render the back facing portions of all following area definitions if the interior style is set to `1=HOLLOW` (see GPIS - Set Interior Style) and the edge flag is set to `1=OFF` (see GPEF - Set Edge Flag) or if the interior style is set to `1=HOLLOW` the interior style is set to `2=SOLID` or `4=HATCH`.

Face distinguish mode must be set to `2=COLOR_SURFACE_PROPERTIES` If the face distinguish mode is `1=NONE`, then the graPHIGS API uses the current interior color to render the back facing portions of all following area definitions.

This attribute sets the same traversal state as the Set Back Interior Color Index (**GPBICI**) subroutine. The traversal default for back interior color is the content of entry 1 of the rendering color table.

Parameters

color — **specified by user, 3 short floating-point numbers**
Three color components of the current direct color model in the graPHIGS API state list (0.0<=component<=1.0).

Error Codes

GPBICI - Set Back Interior Color Index

GPBICI (*index*)

Purpose

Use **GPBICI** to insert a Set Back Interior Color Index structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Back Interior Color Index structure element depending on the current edit mode.

This structure element specifies an entry in the workstation's rendering color table that defines the color values. During structure traversal, the graPHIGS API uses these values to render the back facing portions of all following area definitions if the interior style is set to `1=HOLLOW` and the edge flag is set to `1=OFF` or if the interior style is `2=SOLID` or `4=HATCH`.

Face distinguish mode must be set to `2=COLOR_SURFACE_PROPERTIES` If the face distinguish mode is `1=NONE`, then the graPHIGS API uses the current interior color to render the back facing portions of all following area definitions.

This attribute sets the same traversal state as the Set Back Interior Color Direct (**GPBICD**) subroutine. The traversal default value for back interior color is an index value of 1.

If the workstation does not support the specified back interior color index value, then the back interior color index defaults to a value of 1.

Parameters

index — **specified by user, fullword integer**
        Color index (>=0).

GPBISM - Set Back Interior Shading Method

GPBISM (*method*)

Purpose

Use **GPBISM** to insert a Set Back Interior Shading Method structure element into the open structure following the element pointer, or to replace the element pointed at by the element pointer with a Set Back Interior Shading Method element, depending on the current edit mode.

The graPHIGS API uses this element to specify the shading method used for the interior of back facing portions of subsequent area primitives.

This element specifies the way to shade the interior of back facing portions of subsequent area primitives. The specified method is used if the face distinguish mode (**GPFDMO**) is set to

2=COLOR_SURFACE_PROPERTIES. The interior shading methods include 1=SHADING_NONE, which is also known as *flat* shading, 2=SHADING_COLOR, traditionally known as *Gourand* shading, and 3=SHADING_DATA. See *The graPHIGS Programming Interface: Understanding Concepts (POWER-based System Only)* for information on the interactions between lighting, shading and data mapping.

The traversal default for interior shading method is 2=SHADING_COLOR. If the workstation does not support the specified shading method, then the graPHIGS API uses 2=SHADING_COLOR.

Parameters

method — **specified by user, fullword integer**
Interior shading method (1=SHADING_NONE, 2=SHADING_COLOR, 3=SHADING_DATA).

Error Codes

5	FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)

GPBLF - Set Blending Function

GPBLF (*srcf, destf*)

Purpose

Use **GPBLF** to insert a Set Blending Function structure element into the open structure following the element pointer, or to replace the element pointed at by the element pointer with a Set Blending Function structure element, depending upon the current edit mode.

Blending is a method of combining the colors of the primitive being rendered (called the *source*) with previously rendered output (called the *destination*) to create a new color for the destination. The blending function specifies how you combine the source and destination colors. Conceptually:

$$COLOR = (\ srcf \ x \ COLOR_{src}\ ) + (\ destf \ x \ COLOR_{dest}\ )$$

where *srcf* and *destf* are the source and destination blending functions respectively.

This element specifies the source blending function (*srcf*) and the destination blending function (*destf*) you use when you blend subsequent primitives with previously rendered output. Blending occurs when the Transparency Processing Mode of the view table entry is 3=BLEND or 4=BLEND_ALL.

The traversal default for *srcf* is 3=SRCBF_SRC_ALPHA and for *destf* is 4=DSTBF_ONE_MINUS_SRC_ALPHA.

If face distinguish mode is `1=NONE`, then use these values to calculate the blending effects on both front and back facing portions of area primitives. If face distinguish mode is `2=COLOR_SURFACE_PROPERTIES`, then use these values to calculate the blending effects on only front facing portions of area primitives.

The source and destination blending functions are selected by your application using the *srcf* and *destf* parameters for **GPBLF** as indicated in the following table:

Source function ID	*srcf*	Destination function ID	*destf*
1	0	1	0
2	1	2	1
3	$alpha_{src}$	3	$alpha_{src}$
4	1 - $alpha_{src}$	4	1 - $alpha_{src}$
5	$alpha_{dest}$	5	$alpha_{dest}$
6	1 - $alpha_{dest}$	6	1 - $alpha_{dest}$
7	R_{dest}, G_{dest}, B_{dest}, or $alpha_{dest}$	7	R_{src}, G_{src}, B_{src}, or $alpha_{src}$
8	1 - (R_{dest}, G_{dest}, B_{dest}, or $alpha_{dest}$)	8	1 - (R_{src}, G_{src}, B_{src}, or $alpha_{src}$)
9	min ($alpha_{src}$, 1 - $alpha_{dest}$)		

For example, if *srcf* has the value `2=SRCBF_ONE` and *destf* has the value `1=DSTBF_ZERO`, then the blending function becomes:

$COLOR$ = (1.0 x $COLOR_{src}$) + (0.0 x $COLOR_{dest}$)

which causes the source color to replace the destination color.

In the table the blending coefficients, also called *alpha values* (alpha), are floating point numbers in the range [0.0,1.0] where 0.0 is fully transparent and 1.0 is fully opaque (opposite of the definition of a transparency coefficient). The source blending coefficient ($alpha_{src}$) is calculated from the source transparency coefficient (*coeff*) as follows:

$alpha_{src}$ = 1.0 - coeff

where coeff is in the range [0.0,1.0] and is specified by the Set Transparency Coefficient procedure (**GPTCO**), or by the transparency coefficient of the Set Surface Properties subroutine (**GPSPR**). (These two subroutines set the same transparency coefficient). You can also specify the transparency coefficient as part of the vertex information of certain primitives. Alternately, you can directly supply alpha values and transparency coefficients as part of a texture map. Where available, the alpha buffer provides the destination blending coefficient ($alpha_{dest}$) defined by some of the blending functions. If a blending function is not supported by the workstation, or if a destination blending function is specified on a workstation that does not have alpha buffers, then the element is ignored. Use **GPQWDT** to inquire the transparency facilities of a specific workstation.

A new blending coefficient is calculated from the blending equation and stored with each color (pixel) on those workstations which support alpha buffers. Those workstations which do not support alpha buffers do not support blending functions which include $alpha_{dest}$. The $alpha_{dest}$ value is typically stored as an integer in the range [0,255]. The initial $alpha_{dest}$ value for a view's shield can be specified using the Set Extended View Representation (**GPXVR**).

Parameters

srcf— **specified by user, fullword integer**

Source blending function (1=SRCBF_ZERO, 2=SRCBF_ONE, 3=SRCBF_SRC_ALPHA, 4=SRCBF_ONE_MINUS_SRC_ALPHA, 5=SRCBF_DST_ALPHA, 6=SRCBF_ONE_MINUS_DST_ALPHA, 7=SRCBF_DST_COLOR, 8=SRCBF_ONE_MINUS_DST_COLOR, 9=SRCBF_MIN_SRC_ALPHA_ONE_MINUS_DST_ALPHA).

destf— **specified by user, fullword integer**

Destination blending function (1=DSTBF_ZERO, 2=DSTBF_ONE, 3=DSTBF_SRC_ALPHA, 4=DSTBF_ONE_MINUS_SRC_ALPHA, 5=DSTBF_DST_ALPHA, 6=DSTBF_ONE_MINUS_DST_ALPHA, 7=DSTBF_SRC_COLOR, 8=DSTBF_ONE_MINUS_SRC_COLOR).

GPBRMO - Set Back Reflectance Model

GPBRMO (*model*)

Purpose

Use **GPBRMO** to insert a Set Back Reflectance Model structure element into the open structure following the element pointer, or to replace the element pointed at by the element pointer with a Set Reflectance Model structure element, depending on the current edit mode.

This element specifies the lighting reflectance model that the graPHIGS API uses when performing lighting calculations on back facing portions of subsequent area primitives. If the face distinguish mode (**GPFDMO**) is set to 2=COLOR_SURFACE_PROPERTIES, then the graPHIGS API uses the specified back reflectance model.

The defined back reflectance models and their effect are as follows:

1=REFLECTANCE_NONE	No reflectance calculation is performed.
2=AMB	Ambient reflectance effects are computed.
3=AMB_DIFF	Ambient and diffuse reflectance effects are computed.
4=AMB_DIFF_SPEC	Ambient, diffuse, and specular reflectance effects are computed.

The traversal default for the reflectance model is `1=REFLECTANCE_NONE`. If the workstation does not support the specified model, then the graPHIGS API uses `1=REFLECTANCE_NONE`.

Parameters

model — **specified by user, fullword integer**
> Back reflectance model (`1=REFLECTANCE_NONE, 2=AMB, 3=AMB_DIFF, 4=AMB_DIFF_SPEC`).

Error Codes

GPBSCD - Set Back Specular Color Direct

GPBSCD (*color*)

Purpose

Use **GPBSCD** to insert a Set Back Specular Color Direct structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Back Specular Color Direct structure element depending on the current edit mode.

This structure element specifies the color values that the graPHIGS API uses for the specular highlights at structure traversal time. The specular highlights are produced by lighting calculations in area geometries.

Face distinguish mode (**GPFDMO**) must be set to `2=COLOR_SURFACE_PROPERTIES`. If the face distinguish mode is `1=NONE`, then the graPHIGS API uses the current specular color in lighting calculations for back facing portions of subsequent surfaces.

This attribute sets the same traversal state as the Set Back Specular Color Index (**GPBSCI**) subroutine. The traversal default for back specular color is the content of entry 1 of the rendering color table.

Parameters

color — **specified by user, 3 short floating-point numbers**
> Three color components of the current direct color model in the graPHIGS API state list (0.0<=component<=1.0).

Error Codes

GPBSCI - Set Back Specular Color Index

GPBSCI (*index*)

Purpose

Use **GPBSCI** to insert a Set Back Specular Color Index structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Back Specular Color Index structure element depending on the current edit mode.

This structure element specifies an entry in the workstation's rendering color table that defines the color values. At structure traversal time, the graPHIGS API uses these values for the specular highlights. The specular highlights are produced by lighting calculations in area geometries.

Face distinguish mode must be set to `2=COLOR_SURFACE_PROPERTIES`. If face distinguish mode is `1=NONE`, then the graPHIGS API uses the current specular color in lighting calculations for the back facing portions of the surfaces.

This attribute sets the same traversal state as the Set Back Specular Color Direct (**GPBSCD**) subroutine. The traversal default for back specular color is a color index of 1.

If the workstation does not support the specified color index value or the specified index is outside the color table limit, then the color index defaults to a value of 1.

Parameters

index — **specified by user, fullword integer**
Color index (>=0).

Error Codes

5	FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)
92	COLOR INDEX < ZERO

GPBSPR - Set Back Surface Properties

GPBSPR (*amb*, *diff*, *spec*, *exp*, *trans*)

Purpose

Use **GPBSPR** to insert a Set Back Surface Properties structure element into the open structure following the element pointer, or to replace the element pointed at by the element pointer with a Set Back Surface Properties structure element depending on the current edit mode.

During structure traversal, this structure element specifies the coefficients and exponents used in calculating lighting and transparency effects.

Face distinguish mode (**GPFDMO**) must be `2=COLOR_SURFACE_PROPERTIES` for the graPHIGS API to use these values to calculate the lighting and transparency effects on the back facing portions of a surface. If face distinguish mode is `1=NONE`, then the graPHIGS API uses the current surface properties to calculate the effects on the back facing portions of a surface.

The traversal default coefficients and exponent for the back surface properties are as follows:
- *amb* = 1.0 (back ambient reflection coefficient)
- *diff* = 1.0 (back diffuse reflection coefficient)
- *spec* = 1.0 (back specular reflection coefficient)
- *exp* = 0.0 (back specular reflection exponent) (i.e., no specular effect)
- *trans* = 0.0 (back transparency coefficient) (i.e., opaque)

To use the specified transparency coefficient, the transparency mode for the view must be a value other than `1=NONE`. The current back transparency coefficient in the graPHIGS API Traversal State List is also set by the back transparency coefficient of the Set Back Transparency Coefficient (**GPBTCO**) subroutine.

Parameters

amb — **specified by user, short floating-point number**
    Back ambient reflection coefficient (0<= *amb*<=1).

diff — **specified by user, short floating-point number**
    Back diffuse reflection coefficient (0<= *diff*<=1).

spec — **specified by user, short floating-point number**
    Back specular reflection coefficient (0<= *spec*<=1).

exp — **specified by user, short floating-point number**
    Back specular reflection exponent (>=0).

trans — **specified by user, short floating-point number**
    Back transparency coefficient (0<= *trans*<=1).

Error Codes

GPBTCO - Set Back Transparency Coefficient

GPBTCO (*coeff*)

Purpose

Use **GPBTCO** to insert a Set Back Transparency Coefficient structure element into the open structure following the element pointer, or to replace the element pointed at by the element pointer with a Set Back Transparency Coefficient structure element, depending upon the current edit mode.

During traversal, the value of *coeff* specifies the source transparency coefficient of subsequent back facing portions of area primitives. The graPHIGS API uses the specified coefficient if the face distinguish mode (**GPFDMO**) is set to 2=COLOR_SURFACE_PROPERTIES. The use of the transparency coefficient depends on the Transparency Processing Mode of the view table entry.

The current back transparency coefficient in the graPHIGS API Traversal State List is also set by the back transparency coefficient of the Set Back Surface Properties (**GPBSPR**) subroutine.

The traversal default for the back transparency coefficient value is 0.0.

Parameters

coeff **— specified by user, short floating-point number**
   Back transparency coefficient (0.0<=*coeff*<=1.0).

Error Codes

5	FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)
115	TRANSPARENT COEFFICIENT IS INVALID

GPCAC - Set Curve Approximation Criteria

GPCAC (*criteria*, *value*)

Purpose

Use **GPCAC** to insert a Set Curve Approximation Criteria structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Curve Approximation Criteria structure element depending on the current edit mode.

During structure traversal, this structure element determines how the graPHIGS API tessellates curves for subsequent curve primitives. *Tessellation* is the dividing of curves into a set of line geometries before they are processed.

Depending on the criteria selected, the graPHIGS API uses the control value by itself or the control value in conjunction with the tessellation vector in the curve primitive definition, to determine how curves will be tessellated.

The traversal default for curve approximation criteria is `1=WORKSTATION_DEPENDENT` and a control value of 1.0.

If the workstation does not support the specified curve approximation criteria or if the criteria value is outside the allowable range, then the criteria defaults to `1=WORKSTATION_DEPENDENT` and the control value defaults to 1.0

Parameters

criteria — **specified by user, fullword integer**
Curve approximation criteria (`1=WORKSTATION_DEPENDENT`, `3=CONSTANT_SUBDIVISION_BETWEEN_KNOTS`, `8=VARIABLE_SUBDIVISION_BETWEEN_KNOTS`).

value — **specified by user, short floating-point number**
Control value (>=0) Depending on the *criteria* parameter values you specified, control values are as follows:

If *criteria*=1 (`WORKSTATION_DEPENDENT`)
A value of 1.0 specifies a nominal quality curve. A value greater than or less than 1.0 specifies a higher or lower quality curve respectively. Whether or not the tessellation vector in the curve definition is used is workstation dependent. A nominal quality of 1 will typically correspond to a chordal deviation of 1 pixel.

If *criteria*=3 (`CONSTANT_SUBDIVISION_BETWEEN_KNOTS`)
This value is rounded off to the nearest integer and specifies the fixed number of intervals to be used in rendering the corresponding span of the curve. If the tessellation vector is specified in the curve definition, it is ignored.

If *criteria*=8 (`VARIABLE_SUBDIVISION_BETWEEN_KNOTS`)
This value is multiplied by the tessellation vector in the curve definition and rounded off to the nearest integer in rendering the corresponding span of the curve. If the tessellation vector in the curve definition is not present, then the value is rounded off to the nearest integer and this becomes the number of intervals to be used in rendering the corresponding span of the curve (the same as criteria 3).

Error Codes

GPCHH - Set Character Height

> **GPCHH (*height*)**

Purpose

Use **GPCHH** to insert a Set Character Height structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Character Height structure element depending on the current edit mode.

This structure element specifies the character height in Modelling Coordinate (MC) space that the graPHIGS API uses when rendering subsequent geometric text primitives.

The traversal default for character height value is 0.01.

When the graPHIGS API encounters an element of this type, it uses the absolute value of the specified character height. If the workstation does not support a continuous range of character heights, then the graPHIGS API uses the closest supported value.

Parameters

height — **specified by user, short floating-point number (MC)**
      Character height (>0).

Error Codes

5	FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)
78	CHARACTER HEIGHT VALUE <= ZERO

Related Subroutines

GPQGFC   Inquire Geometric Font Characteristics

RCP code

201328652 (X'0C00080C')

GPCHLS - Set Character Line Scale Factor

GPCHLS (*scale*)

Purpose

Use **GPCHLS** to insert a Set Character Line Scale Factor structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Character Line Scale Factor structure element depending on the current edit mode.

This structure element specifies a value that the graPHIGS API uses to determine the height of the characters when rendering all subsequent character line primitives.

This value is multiplied by the nominal height specified in the primitive definition to determine the actual height of the characters. The graPHIGS API maps the calculated value to the closest height available on the workstation.

The traversal default for character line scale factor is 1.0.

Parameters

scale — **specified by user, short floating-point number**
    Character line scale factor (>=0.0).

Error Codes

5	FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)
76	CHARACTER LINE SCALE FACTOR < ZERO

Related Subroutines

GPQGFC   Inquire Geometric Font Characteristics

RCP code

201343241 (X'0C004109')

GPCHPM - Set Character Positioning Mode

GPCHPM (*posmode*)

Purpose

Use **GPCHPM** to insert a Set Character Positioning Mode structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Character Positioning Mode structure element depending on the current edit mode.

The character positioning mode determines whether the graPHIGS API uses the character positioning box for the specific character or the nominal positioning box for the font in rendering annotation and geometric text primitives.

In the symbol definition for fonts, character positioning boxes are defined for the font (all symbols in the font) and optionally for each individual symbol. This structure element only applies if the font contains character positioning boxes defined for each individual symbol. If the font only has a character positioning box defined for the font and not for the individual symbols, then this element does not affect the font.

The traversal default for character positioning mode is `1=CONSTANT`.

Parameters

posmode — **specified by user, fullword integer**
      Character position mode (`1=CONSTANT`, `2=PROPORTIONAL`).

Error Codes

5	FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)
81	CHARACTER POSITIONING MODE IS INVALID

Related Subroutines

GPQXTX   Inquire Extended Text Facilities

RCP code

GPCHSP - Set Character Spacing

GPCHSP (*space*)

Purpose

Use **GPCHSP** to insert a Set Character Spacing structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Character Spacing structure element depending on the current edit mode.

This structure element specifies the additional amount of space the graPHIGS API inserts between characters at structure traversal time to render all subsequent text primitives when the character spacing attribute source flag is set to `2=INDIVIDUAL`.

This value is expressed as a fraction of the height.

The traversal default for character spacing is 0.0.

Parameters

space — **specified by user, short floating-point number**
      Character spacing.

Error Codes

5	FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)

GPCHUB - Set Character Up and Base Vectors

GPCHUB (*up*, *base*)

Purpose

Use **GPCHUB** to insert a Set Character Up and Base Vectors structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Character Up and Base Vectors structure element depending on the current edit mode.

During structure traversal, this structure element sets the current character up vector and base vector entries in the graPHIGS API traversal state list to the specified values.

The character up vector specifies the direction of the font coordinate y-axis within the text reference coordinate system. The character base vector specifies the direction of the font coordinate x-axis within the text reference coordinate system. The vectors need not be perpendicular to one another.

This attribute sets the same traversal state as the Set Character Up Vector (**GPCHUP**) subroutine.

The traversal default value for character up vector is 0.0, 1.0 and the traversal default value for character base vector is 1.0, 0.0.

If the character up and base vector are invalid, then the up vector defaults to 0.0, 1.0, and the base vector value defaults to 1.0, 0.0.

The graPHIGS API normalizes the specified vectors. If the application later inquires the content of this structure element, then the graPHIGS API returns the normalized vectors *not* the original vectors specified by this subroutine.

Parameters

up — **specified by user, 2 short floating-point numbers**
>Character up vector. (Magnitude must be >0).

base — **specified by user, 2 short floating-point numbers**
>Character base vector. (Magnitude must be >0).

Error Codes

5	FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)
80	CHARACTER UP AND BASE VECTORS ARE COLINEAR

Related Subroutines

GPCHUP	Set Character Up Vector
GPTXPR	Set Text Precision

RCP code

201328662 (X'0C000816')

GPCHUP - Set Character Up Vector

GPCHUP (*up*)

Purpose

Use **GPCHUP** to insert a Set Character Up Vector structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Character Up Vector structure element depending on the current edit mode.

During structure traversal, this structure element sets the current character up vector in the graPHIGS API traversal state list to the specified value. The base vector entries reset to the vector that is obtained by rotating the up vector 90 degrees clockwise.

The character up vector specifies the direction of the font coordinate y-axis within the text reference coordinate system. The character base vector specifies the direction of the font coordinate x-axis within the text reference coordinate system.

At structure traversal time, this structure element specifies the y-axis direction of the text coordinate system for characters in a text string that the graPHIGS API uses to render all subsequent geometric text primitives. The character up vector is a two-dimensional vector on the text plane specified by the text primitive. When rendering text primitives, the graPHIGS API uses the character up value along with a default character base vector set at right angles.

This attribute sets the same traversal state as the Set Character Up and Base Vector (**GPCHUB**) subroutine. The traversal default value for character up vector is 0.0, 1.0 and the traversal default value for character base vectors is 1.0, 0.0.

If the character up vector is invalid, then the up vector value defaults to 0.0, 1.0 and the base vector value defaults to 1.0, 0.0.

The graPHIGS API normalizes the specified vector. If the application later inquires the content of this structure element, then the graPHIGS API returns the normalized vector, *not* the original vector specified by this subroutine.

Parameters

up — **specified by user, 2 short floating-point numbers**
Character up vector. (Magnitude must be >0).

Error Codes

5	FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)
79	CHARACTER UP VECTOR HAS LENGTH ZERO

GPCHXP - Set Character Expansion Factor

GPCHXP (*expans*)

Purpose

Use **GPCHXP** to insert a Set Character Expansion Factor structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Character Expansion Factor structure element depending on the current edit mode.

This structure element specifies the character expansion factor that the graPHIGS API uses at structure traversal time to render all subsequent text primitives when the character expansion attribute source flag is set to `2=INDIVIDUAL`.

The value is a fraction of the width/height ratio that the font designer specified. A value of 1.0 reproduces the font designer's width/height ratio.

The traversal default value for character expansion factor is 1.0.

If the workstation does not support a the character expansion factor or the specified expansion factor is negative or zero, then the graPHIGS API uses a default expansion factor of 1.0.

Parameters

expans **— specified by user, short floating-point number**
Character expansion factor (>0).

Error Codes

5	FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)
77	CHARACTER EXPANSION FACTOR <= ZERO

GPCPI - Set Color Processing Index

GPCPI (*index*)

Purpose

Use **GPCPI** to insert a Set Color Processing Mode structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Color Processing Mode structure element depending on the current edit mode.

This structure element specifies an entry in the workstation's color processing table. The attributes defined in the entry control the color processing (color quantization) applied to subsequent primitives.

The traversal default color processing index value is zero.

If the workstation does not support the specified index value or the specified index is outside the color processing table size, then the color processing index value defaults to zero.

Parameters

index — **specified by user, fullword integer**
   Color processing mode index (>=0).

Error Codes

GPDCI - Set Depth Cue Index

GPDCI (*index*)

Purpose

Use**GPDCI** to insert a Set Depth Cue Index structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Depth Cue Index structure element depending on the current edit mode.

This structure element specifies an entry in the workstation's depth cue table. The attributes defined in the entry control how depth cueing is applied to subsequent primitives. Each entry contains the depth cue mode, depth cue color, depth cue reference planes, and depth cue scale factors.

The traversal default depth cue index value is 0.

If the workstation does not support the specified index value or the specified index is outside the depth cue table size, then the depth cue index value defaults to 0.

Parameters

index — **specified by user, fullword integer**
        Depth cue table index (>=0)

GPDFM - Set Data Filtering Method

> **GPDFM (*minfm, magfm, boundu, boundv*)**

Purpose

Use **GPDFM** to insert a Set Data Filtering Method structure element into the open structure following the element pointer, or to replace the element pointed at by the element pointer with a Set Data Filtering Method structure element, depending upon the current edit mode.

This element specifies the filtering methods that the graPHIGS API uses to perform data mapping on subsequent area primitives. When the data mapping method is 2=SINGLE_VALUE_UNIFORM, the *boundv* parameter is ignored.

The traversal default data filtering methods are:

Minification:	1=SAMPLE_IN_BASE
Magnification:	1=SAMPLE_IN_BASE
U-dimension:	1=CLAMP
V-dimension:	1=CLAMP

If any specified value is not supported on the workstation, then the default value is used.

Parameters

minfm — **specified by user, fullword integer**
> Minification filtering method (1=SAMPLE_IN_BASE, 2=INTERP_IN_BASE, 3=SAMPLE_IN_SQUARE_MM, 4=SAMPLE_IN_AND_INTERP_BTWN_SQUARE_MM, 5=INTERP_IN_SQUARE_MM, 6=INTERP_IN_AND_BTWN_SQUARE_MM, 7=SAMPLE_IN_RECT_MM, 8=SAMPLE_IN_AND_INTERP_BTWN_RECT_MM, 9=INTERP_IN_RECT_MM).

magfm — **specified by user, fullword integer**
> Magnification filtering method (1=SAMPLE_IN_BASE, 2=INTERP_IN_BASE).

boundu — **specified by user, fullword integer**
> *u*-dimension bounding method (1=CLAMP, 2=REPEAT).

boundv — **specified by user, fullword integer**
> *v*-dimension bounding method (1=CLAMP, 2=REPEAT).

Error Codes

GPDMI - Set Data Mapping Index

> *GPDMI (index)*

Purpose

Use **GPDMI** to insert a Set Data Mapping Index structure element into the open structure following the element pointer, or to replace the element pointed at by the element pointer with a Set Data Mapping Index structure element, depending upon the current edit mode.

During traversal, the data mapping index specifies the entry in the data mapping table used to perform data mapping on subsequent primitives that are to be data mapped.

The data mapping table is zero based. Entry zero always contains a data mapping entry of 1=DM_METHOD_COLOR. Use **GPQWDT** to determine the number of definable data mapping table entries.

The traversal default data mapping index is zero. If the specified index is not supported on the workstation, then graPHIGS API uses a default index of zero.

Parameters

index — **specified by user, fullword integer**
     Data mapping table index (>= 0).

Error Codes

5	FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)
630	DATA MAPPING INDEX < ZERO

GPDM2 - Set Data Matrix 2

GPDM2 (*matrix*)

Purpose

Use **GPDM2** to insert a Set Data Matrix 2 structure element into the open structure following the element pointer, or to replace the element pointed at by the element pointer with a Set Data Matrix 2 structure element, depending upon the current edit mode.

This element specifies the transformation matrix that the graPHIGS API uses to modify the data mapping values specified in primitives that support data mapping.

The data mapping values are treated as homogeneous points of the form ($u, v,$ 1.0). When used with a data mapping method of 2=SINGLE_VALUE_UNIFORM, the graPHIGS API sets the v coordinate value to 0.0. Otherwise, the graPHIGS API uses indexed vertex data values for the u and v coordinate values. This point is multiplied by the specified matrix. The resulting values are used to perform the data mapping.

The last column of the matrix must have the values 0.0, 0.0, 1.0.

The traversal default data matrix is the identity matrix.

Parameters

matrix — **specified by user, 9 short floating-point numbers**
     Data modification matrix.

     The elements of the matrix must be specified as follows:

```
|m11  M12  0.0|
|m21  M22  0.0|  ---> (m11, m12, 0.0, m21, m22, 0.0, m31, m32, 1.0)
|m31  M32  1.0|
```

Error Codes

GPECD - Set Edge Color Direct

GPECD (*color*)

Purpose

Use **GPECD** to insert a Set Edge Color Direct structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Edge Color Direct structure element depending on the current edit mode.

This structure element specifies the direct color values that the graPHIGS API uses to render the edges of subsequent output primitives to which this attribute applies. The graPHIGS API uses these values at structure traversal time to render the edges of output primitives when the edge color attribute source flag is set to 2=INDIVIDUAL and the edge flag is set to 2=ON.

This attribute sets the same traversal state as the Set Edge Color Index (**GPECI**) subroutine. The traversal default for edge color is the content of entry 1 of the rendering color table.

Parameters

color — **specified by user, 3 short floating-point numbers**
Three color components of the current direct color model in the graPHIGS API state list (0.0<=component<=1.0).

Error Codes

5	FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)
96	COLOR PARAMETER OUT OF RANGE FOR CURRENT COLOR MODEL

GPECI - Set Edge Color Index

GPECI (*index*)

Purpose

Use **GPECI** to insert a Set Edge Color Index structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Edge Color Index structure element depending on the current edit mode.

This structure element specifies an entry in the workstation's rendering color table that defines the color the graPHIGS API uses to render the edges of all output primitives to which this attribute applies. At structure traversal time, the graPHIGS API uses this index to render the edges of output primitives when the edge color aspect source flag is set to `2=INDIVIDUAL` and the edge flag is set to `2=ON`.

This attribute sets the same traversal state as the Set Edge Color Direct (**GPECD**) subroutine. The traversal default for edge color is a color index value of 1.

If the workstation does not support the specified color index value or the specified index is outside the color table limit, then the color index defaults to a value of 1.

Parameters

index — **specified by user, fullword integer**
Color index (>=0).

Error Codes

GPEF - Set Edge Flag

GPEF (*edgefg*)

Purpose

Use **GPEF** to insert a Set Edge Flag structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Edge Flag structure element depending on the current edit mode.

This structure element indicates whether or not to draw the graPHIGS API draws the edge of subsequent polygon primitives during structure traversal. The graPHIGS API uses the specified value if the edge flag aspect source flag is set to `2=INDIVIDUAL`.

An edge flag of `3=GEOMETRY_ONLY` forces the graPHIGS API to raster edges of polygons using a line algorithm as opposed to an area algorithm. This guarantees that a line is drawn coincident with the boundary of a polygon after a polygon is drawn.

The traversal default edge flag is `1=OFF`.

If the workstation does not support the specified edge flag value, then the edge flag defaults to `1=OFF`.

Parameters

edgefg — **specified by user, fullword integer**
        Edge flag (`1=OFF`, `2=ON`, `3=GEOMETRY_ONLY`).

Error Codes

GPEI - Set Edge Index

> **GPEI (*index*)**

Purpose

Use **GPEI** to insert a Set Edge Index structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Edge Index structure element depending on the current edit mode.

This structure element specifies an entry in the workstation's edge bundle table. The entry contains attribute settings for edge flag, edge line type, edge scale factor, and edge color. At structure traversal time, the graPHIGS API uses these attribute settings to render all subsequent polygon primitives for those attributes which have an aspect source flag value set to `1=BUNDLED`.

The traversal default edge index value is 1.

If the workstation does not support the specified index, then the edge index defaults to a value of 1.

Parameters

index **— specified by user, fullword integer**
Edge bundle table index (>=1).

Error Codes

5	FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)
60	BUNDLE INDEX VALUE < ONE

GPELT - Set Edge Linetype

GPELT (*edgelt*)

Purpose

Use **GPELT** to insert a Set Edge Linetype element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Edge Linetype element depending on the current edit mode.

This structure element specifies an index into a workstation line type table that contains line types. The graPHIGS API uses this index to render the edges of all subsequent output primitives if the corresponding edge flag is set to `2=ON`. At structure traversal time, the graPHIGS API uses this line type to render the edges of output primitives when the line type of an edge aspect source flag is set to `2=INDIVIDUAL`.

The traversal default for edge line type is `1=SOLID_LINE`.

If the workstation does not support the specified index, then the edge index defaults to `1=SOLID_LINE`.

Parameters

edgelt **— specified by user, fullword integer**
Specifies an index into the workstation's edge line type table. The table size and specific entries supported are workstation dependent. Use the Inquire Edge Facilities (**GPQEF**) subroutine to determine the supported edge line types on your workstation. The default edge line type table for supported entries is defined with the following line types:

```
1=SOLID_LINE
2=DASHED
3=DOTTED
4=DASH_DOT
```

```
5=LONG_DASH
6=DOUBLE_DOT
7=DASH_DOUBLE_DOT
8-n=SOLID_LINE
```

Any entry may be changed by the Set Linetype Representation (**GPLTR**) subroutine except entry 1.

GPESC - Set Edge Scale Factor

GPESC (*edgesf*)

Purpose

Use **GPESC** to insert a Set Edge Scale Factor structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Edge Scale Factor structure element depending on the current edit mode.

This structure element specifies a value that the graPHIGS API uses to determine how wide to draw the edges of subsequent output primitives to which this attribute applies. At structure traversal time, the graPHIGS API uses this scale factor to determine the width of the edge when the edge scale factor aspect source flag is set to 2=INDIVIDUAL and additionally for polygon output primitives when the corresponding edge flag is set to 2=ON.

The edge scale factor element specifies the edge's width as a fraction of the nominal edge width. The device support multiplies this scale factor by the nominal width of a line on the corresponding device to determine the requested width. The graPHIGS API maps the calculated value to the closest width available on the device. A scale factor of 1.0, which is the traversal default, generates a nominal size line on any workstation.

Parameters

edgesf — **specified by user, short floating-point number**
    Edge scale factor, specified as a fraction of the nominal linewidth.

GPFBC - Set Frame Buffer Comparison

GPFBC (*op*, *mask*, *value*)

Purpose

Use **GPFBC** to insert a Set Frame Buffer Comparison structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Frame Buffer Comparison structure element depending on the current edit mode.

This structure element specifies a set of options to be taken after comparing the current frame buffer content with a comparison value using a comparison mask. When a bit is set to a value of one in the mask, the graPHIGS API uses the corresponding frame buffer contents in the comparison with the specified comparison value.

The traversal default for frame buffer operation is `1=NO_OPERATION`.

GPFBC is identified as GSE 1002.

> **Note:** Not all GSEs are supported on all workstations. Use the List of Available GSEs (**GPQGSE**) subroutine to determine the GSEs which are supported by an open workstation. See also the workstation descriptors in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

op — **specified by user, fullword integer**
        Frame buffer options:

   1=NO_OPERATION
           No comparison is made (*mask* and *value* are not used)

   2=WRITE_WHEN_EQUAL
           Before updating the frame buffer with a new pixel value, the current contents of the frame buffer are compared with the specified comparison color value using the specified

comparison mask. If they are equal, the new color value is put into the frame buffer. If they are not equal, then the current frame buffer pixel is not changed at all. This option is also known as *underpaint*.

3=WRITE_WHEN_NOT_EQUAL
Before updating the frame buffer with a new pixel value, the current contents of the frame buffer are compared with the specified comparison color value using the specified comparison mask. If they are equal, the new pixel value is put into the frame buffer. If they are not equal, the pixel value produced by processing the current line-on-line color attribute is put into the frame buffer. This option is also known as *line-on-line highlighting*.

mask — **specified by user, fullword integer**
Comparison frame buffer mask. A bit set to 1 in the mask indicates the corresponding frame buffer bit plane that will be used in the comparison.

For an indexed frame buffer workstation, its least significant *n* bits (where *n* is the bit depth of the frame buffer) are used for the actual comparison mask. For a component frame buffer workstation, its least significant *n*1 bits, the next least significant *n*2 bits, and the next least significant *n*3 bits are used for each frame buffer component where *n*1, *n*2, *n*3 are the bit depths of the three frame buffer components.

value — **specified by user, fullword integer**
Comparison value. For an indexed frame buffer workstation, the least significant *n* bits (where *n* is the bit depth of the frame buffer) of the comparison value are used for the comparison. For a component frame buffer workstation, its least significant *n*1 bits, the next least significant *n*2 bits, and the next least significant *n*3 bits are used for each frame buffer component where *n*1, *n*2, and *n*3 are the bit depths of the three frame buffer components.

GPFBM - Set Frame Buffer Protect Mask

GPFBM (*mask*)

Purpose

Use **GPFBM** to insert a Set Frame Buffer Protect Mask structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Frame Buffer Protect Mask structure element depending on the current edit mode.

This structure specifies a write protect mask. The effect of the mask is to inhibit writing to the masked bit planes in the frame buffer during the rendering of output primitives.

The traversal default for frame buffer protect mask is zero. If a bit is set to a value of one, the corresponding bit plane is protected and cannot be modified.

GPFBM is identified as GSE 1001.

> **Note:** Not all GSEs are supported on all workstations. Use the Inquire List of Available GSEs (**GPQGSE**) subroutine to determine the GSEs which are supported by an open workstation. See also the workstation descriptors in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

mask — **specified by user, fullword integer**
Frame buffer protect mask. A bit set to 1 in the mask indicates that the corresponding bit plane is protected and cannot be modified.

For an indexed frame buffer workstation, its least significant n bits (where n is the bit depth of the frame buffer) are used for the actual read/write mask. For a component frame buffer workstation, its least significant $n1$ bits, the next least significant $n2$ bits, and the next least significant $n3$ bits are used for each frame buffer component where $n1$, $n2$, and $n3$ are the bit depths of the three frame buffer components.

GPFDMO - Set Face Distinguish Mode

GPFDMO (*mode*)

Purpose

Use **GPFDMO** to insert a Set Face Distinguish Mode structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Face Distinguish Mode structure element depending on the current edit mode.

During structure traversal, this structure element sets the current face distinguish mode entry in the graPHIGS API traversal state list to the value specified by the parameter. The graPHIGS API uses this value when creating subsequent area defining output primitives.

Face distinguish mode must be set to `2=COLOR_SURFACE_PROPERTIES` for the graPHIGS API to apply the front face color and surface properties attributes to the front face facets, and to apply the back face color and surface properties attributes to back face facets. If face distinguish mode is set to `1=NONE`, then the graPHIGS API applies front face color and surface properties attributes to both the front and back face facets.

The traversal default for face distinguish mode is 1=NONE.

Parameters

mode — **specified by user, fullword integer**
> Face distinguish mode (1=NONE, 2=COLOR_SURFACE_PROPERTIES).

Error Codes

5　　FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)

88　　FACE DISTINGUISH MODE IS INVALID

GPFLM - Set Face Lighting Method

GPFLM (*flmeth*)

Purpose

Use **GPFLM** to insert a Set Face Lighting Method structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Face Lighting Method structure element depending on the current edit mode.

During structure traversal, this structure element sets the face lighting method entry of the graPHIGS API traversal state list to the value specified by the parameter. This value is used during the lighting of primitives which define area.

Face lighting options enable you to position an object in relation to a light source and a viewer. For instance, if a viewer is in front of a opaque object and the light source is on the other, the viewer does not see the light and the side of the viewer is dark or in the shadows. 2=FACE_DEPENDENT enables this effect. 1=FACE_INDEPENDENT disables the effect. For more information on face lighting options, see face-dependent lighting in *The graPHIGS Programming Interface: Understanding Concepts*.

The traversal default for face lighting method is 1=FACE_INDEPENDENT.

If the workstation does not support the specified face lighting method, then the face lighting method defaults to 1=FACE_INDEPENDENT.

Parameters

flmeth — **specified by user, fullword integer**
> Face lighting method (1=FACE_INDEPENDENT, 2=FACE_DEPENDENT).

Error Codes

5　　FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)

299　　FACE LIGHTING METHOD IS INVALID

GPHID - Set HLHSR Identifier

GPHID (*hlhsr*)

Purpose

Use **GPHID** to insert a Set HLHSR Identifier structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set HLHSR Identifier structure element depending on the current edit mode.

During structure traversal, this structure element sets the current HLHSR identifier entry of the graPHIGS API traversal state list to the specified parameter. The application uses this value when creating subsequent output primitives in a view with a HLHSR mode other than 1=OFF.

If the workstation does not support the specified HLHSR identifier, then the HLHSR identifier defaults to a value of 1=VISUALIZE_IF_NOT_HIDDEN. In a view with HLHSR mode set to 1=OFF, this value is completely ignored and has no affect on the visualization of primitives.

HLHSR processing is often implemented by use of a z-buffer and a frame buffer. The following table summarizes the effect of the various HLHSR identifiers on the z-buffer and the frame buffer:

Table 3. HLHSR Processing

Summary of when the frame buffer and the z-buffer are updated.		
	Frame buffer	**Z-buffer**
1=VISUALIZE_IF_NOT_HIDDEN	$Z_{prim} >= Z_{buf}$	$Z_{prim} >= Z_{buf}$
2=VISUALIZE_IF_HIDDEN	$Z_{prim} < Z_{buf}$	Never
3=VISUALIZE_ALWAYS	Always	Always
4=NOT_VISUALIZE	Never	$Z_{prim} >= Z_{buf}$
5=FACE_DEPENDENT_VISUALIZATION		
Front-facing Areas	$Z_{prim} >= Z_{buf}$	$Z_{prim} >= Z_{buf}$
Back-facing Areas	$Z_{prim} > Z_{buf}$	$Z_{prim} > Z_{buf}$
6=NO_UPDATE	Never	Never
7=GREATER_THAN	$Z_{prim} > Z_{buf}$	$Z_{prim} > Z_{buf}$
8=EQUAL_TO	$Z_{prim} = Z_{buf}$	$Z_{prim} = Z_{buf}$
9=LESS_THAN	$Z_{prim} < Z_{buf}$	$Z_{prim} < Z_{buf}$
10=NOT_EQUAL	$Z_{prim} <> Z_{buf}$	$Z_{prim} <> Z_{buf}$
11=LESS_THAN_OR_EQUAL_TO	$Z_{prim} <= Z_{buf}$	$Z_{prim} <= Z_{buf}$

Note: The actual update of the z-buffer and/or the frame buffer may be prohibited by the use of the z-buffer protect mask and the frame buffer protect mask.

Parameters

hlhsr — **specified by user, fullword integer**
> HLHSR identifier (1=VISUALIZE_IF_NOT_HIDDEN, 2=VISUALIZE_IF_HIDDEN, 3=VISUALIZE_ALWAYS, 4=NOT_VISUALIZE, 5=FACE-DEPENDENT_VISUALIZATION, 6=NO_UPDATE, 7=GREATER_THAN, 8=EQUAL_TO, 9=LESS_THAN, 10=NOT_EQUAL, 11=LESS_THAN_OR_EQUAL_TO).

GPHLCD - Set Highlighting Color Direct

GPHLCD (*color*)

Purpose

Use **GPHLCD** to insert a Set Highlighting Color Direct structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Highlighting Color Direct structure element depending on the current edit mode.

This structure element specifies the direct color values the graPHIGS API uses to render all subsequent highlighted primitives. This color overrides any color specified by the attribute color for the primitive or specified in the primitive definition.

This attribute sets the same traversal state as the Set Highlighting Color Index (**GPHLCI**) subroutine. The traversal default for highlighting color is the content of entry 1 of the rendering color table.

Parameters

color — **specified by user, 3 short floating-point numbers**
> Three color components of the current direct color model in the graPHIGS API state list (0.0<=component<=1.0).

Error Codes

5   FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)

GPHLCI - Set Highlighting Color Index

GPHLCI (*index*)

Purpose

Use **GPHLCI** to insert a Set Highlighting Color Index structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Highlighting Color Index structure element depending on the current edit mode.

This structure element specifies an entry in the workstation's rendering color table that contains the color the graPHIGS API uses to render all subsequent highlighted primitives. This color overrides any color specified by the attribute color for the primitive or specified in the primitive definition.

This attribute sets the same traversal state as the Set Highlighting Color Direct (**GPHLCD**) subroutine. The traversal default for highlighting color is a color index value of 1.

If the workstation does not support the specified index, then the color index defaults to a value of 1.

Parameters

index — **specified by user, fullword integer**
Color index (>=0).

Error Codes

5   FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)

92   COLOR INDEX < ZERO

GPICD - Set Interior Color Direct

GPICD (*color*)

Purpose

Use **GPICD** to insert a Set Interior Color Direct structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Interior Color Direct structure element depending on the current edit mode.

This structure element specifies the direct color values the graPHIGS API uses to fill all following polygon definitions if the interior style is set to `1=HOLLOW` and edge is `1=OFF` or if the interior style is set to `2=SOLID` or `4=HATCH`.

Face distinguish mode must be set to `2=COLOR_SURFACE_PROPERTIES` for the graPHIGS API to use these values to fill the front facing portions only. If the face distinguish mode is `1=NONE`, then the graPHIGS API uses these values to fill both the front facing and back facing portions of the area defining primitives.

At structure traversal time, the graPHIGS API uses these values to render the interiors when the interior color aspect source flag is set to `2=INDIVIDUAL`.

This attribute sets the same traversal state as the Set Interior Color Index (**GPICI**) subroutine. The traversal default for interior color is the content of entry 1 of the rendering color table.

Parameters

color **— specified by user, 3 short floating-point numbers.**
> Three color components of the current structure color model in the graPHIGS API state list (0.0<=component<=1.0).

Error Codes

GPICI - Set Interior Color Index

GPICI (*index*)

Purpose

Use **GPICI** to insert a Set Interior Color Index structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Interior Color Index structure element depending on the current edit mode.

This structure element specifies an entry in the workstation's rendering color table that contains the color values the graPHIGS API uses to fill all following polygon definitions if the interior style is set to `1=HOLLOW` and edge is `1=OFF`, or the interior style is set to `2=SOLID` or `4=HATCH`.

Face distinguish mode must be set to `2=COLOR_SURFACE_PROPERTIES` for the graPHIGS API to fill the front facing properties only. If the face distinguish mode is `1=NONE`, then the graPHIGS API uses the color values to fill both the front facing and back facing portions of the polygon definitions.

This index is used at structure traversal time to render the interiors when the interior color aspect source flag is set to `2=INDIVIDUAL`.

This attribute sets the same traversal state as the Set Interior Color Direct (**GPICD**) subroutine. The traversal default for interior color is a color index value of 1.

If the workstation does not support the specified index, then the color index defaults to a value of 1.

Parameters

index **— specified by user, fullword integer**
    Color index (>=0).

Error Codes

GPII - Set Interior Index

> GPII (*index*)

Purpose

Use **GPII** to insert a Set Interior Index structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Interior Index structure element depending on the current edit mode.

This structure element specifies an entry in the workstation's interior bundle table. The entry contains attribute settings for interior style, interior style index, and color. At structure traversal time, the graPHIGS API uses these attribute settings to render all subsequent polygon primitives for those attributes which have an aspect source flag set to `1=BUNDLED`.

The traversal default interior index is 1.

If the workstation does not support the specified index, then the interior index defaults to a value of 1.

Parameters

index — **specified by user, fullword integer**
> Interior bundle table index (>=1).

Error Codes

5   FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)

60   BUNDLE INDEX VALUE < ONE

GPIS - Set Interior Style

GPIS (*style*)

Purpose

Use **GPIS** to insert a Set Interior Style structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Interior Style structure element depending on the current edit mode.

This structure element specifies the way the graPHIGS API draws the interior of a polygon at structure traversal time when rendering all subsequent polygon (fill area) primitives. The graPHIGS API uses this style value when the interior style aspect source flag is set to `2=INDIVIDUAL`.

The traversal default for interior style is `1=HOLLOW`.

If the workstation does not support the specified interior style, then the interior style defaults to `1=HOLLOW`.

Parameters

style — **specified by user, fullword integer**
 Interior style (1=HOLLOW, 2=SOLID, 3=PATTERN, 4=HATCH, 5=EMPTY).

Error Codes

GPISI - Set Interior Style Index

GPISI (*index*)

Purpose

Use **GPISI** to insert a Set Interior Style Index structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Interior Style Index structure element depending on the current edit mode.

This structure element specifies an index into the workstation hatch table if the current interior style is 4=HATCH. If the current interior style is 3=PATTERN, then this structure element specifies an index into the workstation pattern table. The graPHIGS API uses this value at structure traversal time when rendering all subsequent area defining primitives when the interior style index aspect source flag is set to 2=INDIVIDUAL.

If the current interior style is *not* a hatch or pattern interior style, then the graPHIGS API ignores this structure element and the element counter is simply incremented.

The traversal default interior style index value is 1.

If the workstation does not support the specified index, then the interior style index defaults to a value of 1.

Parameters

index — **specified by user, fullword integer**
 Interior style index (>=1).

 The default hatch table for workstations is defined as follows:

1. Vertical lines.
2. Horizontal lines.
3. Diagonal lines, lower left to upper right, wide spacing.
4. Diagonal lines, lower left to upper right, medium spacing.
5. Diagonal lines, lower right to upper left, wide spacing.
6. Diagonal lines, lower right to upper left, medium spacing.

GPISM - Set Interior Shading Method

GPISM (*method*)

Purpose

Use **GPISM** to insert a Set Interior Shading Method structure element into the open structure following the element pointer, or to replace the element pointed at by the element pointer with a Set Interior Shading Method structure element, depending on the current edit mode.

The graPHIGS API uses this element to specify the shading of the interior of subsequent area primitives.

If the face distinguish mode (**GPFDMO**) is 1=NONE, then the graPHIGS API uses this method to shade the interior of both front and back facing portions of area primitives. If the face distinguish mode is 2=COLOR_SURFACE_PROPERTIES, then the graPHIGS API uses this method only on front facing portions of subsequent area primitives.

The interior shading methods include 1=SHADING_NONE which is also known as *flat* shading, 2=SHADING_COLOR, traditionally known as *Gourand* shading, and 3=SHADING_DATA. See *The graPHIGS Programming Interface: Understanding Concepts* for information on the interactions between lighting, shading, and data mapping.

For compatibility, the Set Interior Shading Method traversal state is also set by the **GPLMO** subroutine. For more information, see *The graPHIGS Programming Interface: Understanding Concepts*.

The traversal default interior shading method is 2=SHADING_COLOR. If the workstation does not support the specified method, then the graPHIGS API uses 2=SHADING_COLOR.

Parameters

method — **specified by user, fullword integer**
Interior shading method (1=SHADING_NONE, 2=SHADING_COLOR, 3=SHADING_DATA).

GPLLCD - Set Line-on-Line Color Direct

GPLLCD (*color*)

Purpose

Use **GPLLCD** to insert a Set Line-on-Line Color Direct structure element into the open structure following the element pointer, or to replace the element pointed at by the element pointer with a Set Line-on-Line Color Direct structure element, depending upon the current edit mode.

This structure element specifies the direct color values that the graPHIGS API uses when highlighting using the Set Frame Buffer Comparison (**GPFBC**)option `3=WRITE_WHEN_NOT_EQUAL`.

Depending upon the results of the Frame Buffer Comparison, this color overrides any color specified either by the attribute color for the primitive or in the primitive's definition.

This attribute sets the same traversal state as the Set Line-on-Line Color Index (**GPLLCI**) subroutine. The traversal default for the line-on-line color is the content of entry 1 of the rendering color table.

GPLLCD is identified as GSE 1011.

> **Note:** Not all GSEs are supported on all workstations. Use the List of Available GSEs (**GPQGSE**) subroutine to determine the GSEs which are supported by an open workstation. See also the workstation descriptors in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

color— **specified by user, 3 short floating-point numbers**
Three color components of the current direct color model in the graPHIGS API state list (0.0<=component<=1.0).

GPLMO - Set Lighting Calculation Mode

GPLMO (*mode*)

Purpose

Use **GPLMO** to insert a Set Lighting Calculation Mode structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Lighting Calculation Mode structure element depending on the current edit mode.

This structure element specifies a mode which the graPHIGS API uses at structure traversal time to control the lighting process of subsequent area defining output primitives in order to control the quality and

performance of the resulting display. Performance typically decreases as quality increases. This value selects the most coarse granularity at which lighting calculations are to be performed.

The traversal default for lighting calculation mode is `1=NONE`.

If the workstation does not support the specified mode, then the lighting calculation mode defaults to `1=NONE`.

Parameters

mode — **specified by user, fullword integer**
 Lighting calculation mode (`1=NONE`, `2=PER_AREA`, `3=PER_VERTEX`).

Error Codes

5 FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL).

257 LIGHTING CALCULATION MODE IS INVALID.

GPLSS - Set Light Source State

GPLSS (*nact*, *act*, *ndea*, *dea*)

Purpose

Use **GPLSS** to insert a Set Light Source State structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Light Source State structure element depending on the current edit mode.

This structure element specifies a list of light source indexes to be added to the current light source state and a list of light source indexes to be deleted from the current light source state. Each index points to an entry in the workstation's light source table. Each table entry contains the set of characteristics of a light

source that the graPHIGS API uses at structure traversal time to calculate lighting effects. The characteristics include light source type, light source color, and some light source dependent parameters.

If a light source index in the activation list already exists in the current light source state, it is ignored. If a light source index in the deactivation list does not exist in the current light source state, it is ignored. If the workstation does not support the light source index, then the graPHIGS API ignores the light source index.

The traversal default for light source state is no light sources (an empty list).

Parameters

nact — **specified by user, fullword integer**
Number of light sources to be added to the current light source state (>=0).

act — **specified by user, array of fullword integers**
Light source indexes to be added to the current light source state (>=1).

ndea — **specified by user, fullword integer**
Number of light sources to be deleted from the current light source state (>=0).

dea — **specified by user, array of fullword integers**
Light source indexes to be deleted from the current light source state (>=1).

GPLT (*ltype*)

Purpose

Use **GPLT** to insert a Set Linetype structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Linetype structure element depending on the current edit mode.

This structure element specifies an index into a workstation line type table that contains line types that the graPHIGS API uses to render all subsequent output primitives to which this attribute applies. At traversal time, the graPHIGS API uses the line type to render the output primitives when the line type aspect source flag is set to `2=INDIVIDUAL`.

The traversal default for line type is `1=SOLID_LINE`.

If the workstation does not support the specified line type, then the line type defaults to `1=SOLID_LINE`.

Parameters

ltype — **specified by user, fullword integer**
> Specifies an index into the workstation's line type table. The table size and specific entries supported are workstation dependent. Use the Inquire Polyline Facilities (**GPQPLF**) subroutine to determine the supported line types on your workstation. The size of the line type table is workstation dependent. The default line type table for supported entries is defined with the following line types: (`1=SOLID_LINE, 2=DASHED, 3=DOTTED, 4=DASH_DOT, 5=LONG_DASH, 6=DOUBLE_DOT, 7=DASH_DOUBLE_DOT, 8-n=SOLID_LINE`). Use the Set Linetype Representation (**GPLTR**) subroutine to change any entry except for entry 1.

GPLWSC - Set Linewidth Scale Factor

GPLWSC (*lwidth*)

Purpose

Use **GPLWSC** to insert a Set Linewidth Scale Factor structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Linewidth Scale Factor structure element depending on the current edit mode.

This structure element specifies the width of the line as a fraction of the nominal. The device support multiplies this scale factor times the nominal line width on the corresponding device to determine the requested width. The graPHIGS API maps the calculate value to the closest width available on the device. A scale factor of 1.0 generates a nominal size line on any workstation. At structure traversal, the graPHIGS API uses this scale factor when the line width scale factor aspect source flag is set to `2=INDIVIDUAL`.

The traversal default for linewidth scale factor is a linewidth scale factor of 1.0.

Parameters

lwidth **— specified by user, short floating-point number**
  Line width scale factor.

Error Codes

GPMSSC - Set Marker Size Scale Factor

GPMSSC (*msize*)

Purpose

Use **GPMSC** to insert a Set Marker Size Scale Factor structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Marker Size Scale Factor structure element depending on the current edit mode.

This element specifies the marker's size as a fraction of the nominal marker size. The device support multiplies this scale factor times the nominal size of markers on the corresponding device to determine the requested size. The graPHIGS API maps the calculated value to the closest size available on the device. A scale factor of 1.0 generates a nominal size marker on any workstation. At structure traversal, the graPHIGS API uses this marker size scale factor when the marker size scale factor aspect source flag is set to `2=INDIVIDUAL`.

The traversal default for marker size scale factor is a marker size scale factor of 1.0.

Parameters

msize — **specified by user, short floating-point number**
    Marker size scale factor.

Error Codes

GPMT - Set Marker Type

GPMT (*mtype*)

Purpose

Use **GPMT** to insert a Set Marker Type structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Marker Type structure element depending on the current edit mode.

This structure element specifies an index into a workstation markertype table that contains marker types that the graPHIGS API uses to render all subsequent polymarker primitives. At structure traversal time, the graPHIGS API uses this marker type to render the polymarker primitives when the marker type aspect source flag is set to 2=INDIVIDUAL.

The traversal default for marker type is 3=ASTERISK.

If your workstation does not support the specified entry or the entry is outside the allowable range, then the marker type index defaults to 3=ASTERISK.

Parameters

mtype — **specified by user, fullword integer**
    Specifies an index into the marker type table of the workstation. The table size and specific entries supported are workstation dependent. Use the Inquire Polymarker Facilities (**GPQPMF**) subroutine to determine the supported marker types on your workstation. The default marker type table for supported entries is defined with the following marker types: (1=DOT, 2=PLUS_SIGN, 3=ASTERISK, 4=CIRCLE, 5=DIAGONAL_CROSS, 6-n=ASTERISK). Use the Set Marker Type Representation (**GPMTR**) subroutine to change any entry except entry 3.

GPPGC - Set Polygon Culling

GPPGC (*mode*)

Purpose

Use **GPPGC** to insert a Set Polygon Culling structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Polygon Culling structure element depending on the current edit mode.

This structure element specifies a mode. This mode specifies whether or not a given area geometry including its boundaries and edges should be visualized when rendering subsequent primitives to which this attribute applies.

The traversal default for polygon culling is `1=NONE`.

If the workstation does not support the specified mode, then polygon culling mode defaults to `1=NONE`.

Parameters

mode — **specified by user, fullword integer**

Polygon culling mode (`1=NONE`, `2=BACK`, `3=FRONT`)

Error Codes

GPPHEC - Set Polyhedron Edge Culling

GPPHEC (*mode*)

Purpose

Use **GPPHEC** to insert a Set Polyhedron Edge Culling structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Polyhedron Edge Culling structure element depending on the current edit mode.

During structure traversal, this structure element sets the current polyhedron edge culling mode entry in the graPHIGS API traversal state list to the value specified by the parameter. The graPHIGS API uses this value to create subsequent polyhedron edge output primitives. This value supplies polyhedron edge culling information to the workstation. This structure element specifies a mode which defines which orientation of the adjacent area geometries causes the line segments to not be visualized.

A polyhedron edge is a line segment which is the shared edge of two area geometries. A polyhedron edge has two normals representing the geometric normals of the two adjacent areas. Based on the direction of each normal relative to the viewer, the graPHIGS API defines each area geometry as front facing or back facing. A culling mode set to `1=NONE` produces no culling (i.e., area geometries are always visualized). A culling mode of `4=BOTH_BACK_OR_BOTH_FRONT` causes the line segment to not be visualized if both adjacent area geometries are either back facing or front facing.

The traversal default for polyhedron edge culling is `1=NONE`.

If the workstation does not support the specified polyhedron edge, then the polyhedron edge mode defaults to `1=NONE`.

Parameters

mode — **specified by user, fullword integer**
> Polyhedron edge culling mode (`1=NONE, 2=BOTH_BACK, 3=BOTH_FRONT, 4=BOTH_BACK_BOTH_FRONT, 5=BACK_AND_FRONT, 6=LEAST_ONE_BACK, 7=LEAST_ONE_FRONT`)

GPPLCD - Set Polyline Color Direct

GPPLCD (*color*)

Purpose

Use **GPPLCD** to insert a Set Polyline Color Direct structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Polyline Color Direct structure element depending on the current edit mode.

This structure element specifies the direct color values that the graPHIGS API uses to render subsequent output primitives to which this attribute applies. During structure traversal, the graPHIGS API uses these values to render the output primitives when the polyline color aspect source flag is set to `2=INDIVIDUAL`.

This attribute sets the same traversal state as the Set Polyline Color Index (**GPPLCI**) subroutine. The traversal default for polyline color is the content of entry 1 of the rendering color table.

Parameters

color — **specified by user, 3 short floating-point numbers**
      Three color components of the current direct color model in the graPHIGS API state list
      (0.0<=component<=1.0).

Error Codes

GPPLET - Set Polyline End Type

GPPLET (*endtype*)

Purpose

Use **GPPLET** to insert a Set Polyline End Type structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Polyline End Type structure element depending on the current edit mode.

Flat ends are the default setting. The graPHIGS API places flat ends at the line endpoints. Round ends are semicircles centered at the line ends. The diameter of a round end is equal to the width of the line. Square ends extend half a line width past the line's endpoints and are parallel to the last line segment.

The traversal default for polyline end type is `1=FLAT`.

If the workstation does not support the specified polyline end type, then the polyline edge type defaults to `1=FLAT`.

Parameters

endtype — **specified by user, fullword integer**

> Polyline end type (`1=FLAT`, `2=ROUND`, `3=SQUARE`)

Error Codes

GPPLSM - Set Polyline Shading Method

GPPLSM (*method*)

Purpose

Use **GPPLSM** to insert a Set Polyline Shading Method structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Polyline Shading Method structure element depending on the current edit mode.

During structure traversal, the graPHIGS API sets the current polyline shading method in the traversal state list and uses this shading method when rendering subsequent Polyline Set 3 With Data (**GPPLD3**) primitives. If the specified polyline shading method is `1=POLYLINE_SHADING_NONE` and Polyline Set 3 With Data specifies vertex colors in its primitive definition, then the graPHIGS API uses the ith vertex color to color the ith line of the polyline. If the current polyline shading method is `2=POLYLINE_SHADING_COLOR` and Polyline Set 3 With Data specifies vertex colors in its primitive definition, then the graPHIGS API interpolates the color along each line between the colors specified at the endpoints of the line. If the **GPPLSM** primitive definition does not specify a vertex color, then the graPHIGS API renders the entire primitive using the current polyline color and **GPPLSM** has no effect.

The traversal default for polyline shading method is `1=POLYLINE_SHADING_NONE`.

If the specified polyline shading method is not within the allowable range, then the shading method defaults to a value of `1=POLYLINE_SHADING_NONE`.

Parameters

method — **specified by user, fullword integer**
Specifies the polyline shading method to be used with Polyline Set 3 With Data primitives
(`1=POLYLINE_SHADING_NONE`, `2=POLYLINE_SHADING_COLOR`).

GPPSC - Parametric Surface Characteristics

GPPSC (*type*, *data*)

Purpose

Use **GPPSC** to insert a Parametric Surface Characteristics structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Parametric Surface Characteristics structure element depending upon the current edit mode.

During structure traversal, the graPHIGS API uses the *type* and *data* parameters to update the Parametric Surface Characteristic entry in the graPHIGS API traversal state list. The graPHIGS API uses this new state to render all subsequent parametric surface primitives until this traversal state list entry is changed.

The Parametric Surface Characteristic traversal state defines the type of line geometry that is generated in the interior of a parametric surface. When rendering a line geometry, all polyline attributes are applied to the line representation.

When rendering a parametric surface, edges (which are controlled by edge attributes), have priority over line geometries, which have priority over rendering surface interiors (which are controlled by interior attributes).

The traversal default for parametric surface characteristics is `1=NONE`. If a workstation encounters an unsupported *type*, the parametric surface defaults to `1=NONE`.

GPPSC is identified as GSE 1008.

> **Note:** Not all GSEs are supported on all workstations. Use the Inquire List of Generalized Structure Elements (**GPQGSE**) subroutine determine the GSEs which are supported by an open workstation. See also the workstation descriptors in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

type — **specified by user, fullword integer**
     Rendering style that is to be applied to the interior of parametric surfaces (`1=NONE`, `2=ISOPARAMETRIC_LINES`).

data — **specified by user, array of integers**
     Rendering style type dependent data. The required data for each type is listed below. The parameters must be specified in the order shown.

     If *type*=1 (`NONE`)
             The *data* parameter is ignored.

     If *type*=2 (`ISOPARAMETRIC_LINES`)
             The *data* parameter requires the following format:

```
          ---------------------
        │    Scope of        │
      0 │   Isoparametric    │ Fullword integer
```

```
           |       Numbers      |
           |--------------------|
           |    Number of       |
         4 |    Isoparametrics  |
           |    in the U        | Fullword integer >=0
           |    direction       |
           |--------------------|
           |    Number of       |
         8 |    Isoparametrics  |
           |    in the V        | Fullword integer >=0
           |    direction       |
           |--------------------|
```

Scope of Isoparametric Numbers

This field defines whether the number of Isoparametrics is to be applied to the surface as a whole or just between knots (`1=Surface`, `2=Between Knots`). If the surface is uniform and `2=Between Knots` is specified, `1=Surface` is used instead.

Number of Isoparametrics in the U Direction

These curves are drawn parallel to the v-axis of parameter space. For scope of `1=Surface`, this field defines the number of isoparametric curves that are drawn between minimum and maximum parameter limits of the surface. For an untrimmed surface, a value of one would result in an isoparametric curve that is drawn at (vmin+vmax)/2. For a scope of `2=Between Knots`, this field defines the number of isoparametric curves that are to be drawn between knots in addition to isoparametric curves through the knot lines. A value of zero would result in an isoparametric curve being drawn at each knot line within the parameter limits of the surface. A value of one would add a curve placed midway between each pair of knots.

Number of Isoparametrics in the V Direction

This parameter is identical to the previous parameter except the isoparametric curves are drawn parallel to the u-axis.

> **Note:** The graPHIGS API only displays isoparametric curves in the active region of a trimmed surface. This means that the trimming curves clip the isoparametric curves.

GPRCN - Remove Class Name from Set

GPRCN (*number*, *names*)

Purpose

Use **GPRCN** to insert a Remove Class Name from Set structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Remove Class Name from Set structure element depending on the current edit mode.

The class set traversal state consists of a list of class names. During structure traversal, this structure element removes one or more names from the list but does not completely replace the traversal state as other attributes do.

Class names let an application control the eligibility of a primitive for pickability (detectability), highlighting, and invisibility by associating it with a class set. The effects of adding or removing a class name to the current class set are inherited (i.e., by child structures).

When the graPHIGS API encounters a primitive during structure traversal, it uses the list of class names in the class set to determine the pickability (detectability), highlighting, and invisibility aspects. If the workstation does not support a specified name, then the graPHIGS API ignores the name and the name has no effect on the primitive.

Also use class names are to create inclusion and exclusion filters for the specified workstation. The graPHIGS API uses these filters in conjunction with the class set traversal state to determine if pickability, highlighting, and visibility apply. The filters act independently of each other.

During structure traversal, the graPHIGS API compares the current class set to the current filters. When root structure traversal begins, the current class set is null.

For a complete discussion of class names and filters, see *The graPHIGS Programming Interface: Understanding Concepts*.

Parameters

number — **specified by user, fullword integer**
Number of class names to remove from the class set (>=0).

names — **specified by user, array of fullword integers**
Array of class names to remove from the class set (class names must be >=0).

GPRMO - Set Reflectance Model

GPRMO (*model*)

Purpose

Use **GPRMO** to insert a Set Reflectance Model structure element into the open structure following the element pointer, or to replace the element pointed at by the element pointer with a Set Reflectance Model structure element, depending on the current edit mode.

This element specifies the lighting reflectance model that the graPHIGS API uses when performing lighting calculations on subsequent area primitives. If the face distinguish mode (**GPFDMO**) is 1=NONE, then the graPHIGS API uses the specified model to calculate the lighting effects on both front and back facing portions of area primitives. If the face distinguish mode is 2=COLOR_SURFACE_PROPERTIES, then the graPHIGS API uses the specified model to calculate the lighting effects on only front facing portions of area primitives.

The defined reflectance models and their effect are as follows:

1=REFLECTANCE_NONE
> No reflectance calculation is performed.

2=AMB   Ambient reflectance effects are computed.

3=AMB_DIFF
> Ambient and diffuse reflectance effects are computed.

4=AMB_DIFF_SPEC
> Ambient, diffuse, and specular reflectance effects are computed.
>
> For compatibility, the Set Reflectance Model traversal state is also set by the Set Lighting Calculation Mode (**GPLMO**) subroutine. For more information, see *The graPHIGS Programming Interface: Understanding Concepts*.
>
> The traversal default for the reflectance model is 1=REFLECTANCE_NONE. If the workstation does not support the specified method, then the graPHIGS API uses 1=REFLECTANCE_NONE.

Parameters

model — **specified by user, fullword integer**
> Reflectance model (1=REFLECTANCE_NONE, 2=AMB, 3=AMB_DIFF, 4=AMB_DIFF_SPEC).

Error Codes

5   FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)

GPSAC - Set Surface Approximation Criteria

GPSAC (*criteria*, *ctrlval1*, *ctrlval2*)

Purpose

Use **GPSAC** to insert a Set Surface Approximation Criteria structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Surface Approximation Criteria structure element depending on the current edit mode.

This structure element determines how the graPHIGS API tessellates subsequent surfaces during structure traversal. *Tessellation* divides the surfaces into a set of line and/or area geometries for subsequent processing.

Depending on the criteria selected, the graPHIGS API uses only the control values or uses the control values in conjunction with the tessellation vectors in the surface definition to determine how surfaces are tessellated.

The traversal default for surface approximation criteria is 1=WORKSTATION_DEPENDENT with the *u* control value (*ctrlval1*) and *v* control value (*ctrlval2*) parameter values both set to 1.0.

If the workstation does not support the specified criteria, then the criteria defaults to 1=WORKSTATION_DEPENDENT, with *ctrlval1* and *ctrlval2* values both set to 1.0.

For information on surface tessellation and on how surface approximation criteria is applied, see *The graPHIGS Programming Interface: Understanding Concepts*.

Parameters

criteria — **specified by user, fullword integer**
Surface approximation criteria (1=WORKSTATION_DEPENDENT, 3=CONSTANT_SUBDIVISION_BETWEEN_KNOTS, 8=VARIABLE_SUBDIVISION_BETWEEN_KNOTS).

ctrlval1 — **specified by user, short floating-point number**
U-control value (>=0).

ctrlval2 — **specified by user, short floating-point number**
V-control value (>=0).

GPSCD - Set Specular Color Direct

GPSCD (*color*)

Purpose

Use **GPSCD** to insert a Set Specular Color Direct structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Specular Color Direct structure element depending on the current edit mode.

This structure element specifies the color values that the graPHIGS API uses at structure traversal time for the specular highlights produced by lighting calculations on area geometries.

If the face distinguish mode is 1=NONE, then the graPHIGS API uses the color values on both the front facing and back facing surfaces. If the face distinguish mode is set to 2=COLOR_SURFACE_PROPERTIES, then the graPHIGS API uses the color values on the front facing portions only.

This attribute sets the same traversal state as the Set Specular Color Index (**GPSCI**) subroutine. The traversal default for specular color is the content of entry 1 of the rendering color table.

Parameters

color — **specified by user, 3 short floating-point numbers**
>   Three color components of the current direct color model in the graPHIGS API state list
>   (0.0<=component<=1.0).

Error Codes

5   FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)

GPSCI - Set Specular Color Index

GPSCI (*index*)

Purpose

Use **GPSCI** to insert a Set Specular Color Index structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Specular Color Index structure element depending on the current edit mode.

This structure element specifies the color values that the graPHIGS API uses at structure traversal time for the specular highlights produced by lighting calculations on area geometries.

If the face distinguish mode is `1=NONE`, then the graPHIGS API uses the color values on both the front facing and back facing surfaces. If the face distinguish mode is set to `2=COLOR_SURFACE_PROPERTIES`, then the graPHIGS API uses the color values on the front facing portions only.

This attribute sets the same traversal state as the Set Specular Color Direct (**GPSCD**) subroutine. The traversal default for specular color is a color index value of 1.

If the workstation does not support the specified specular color index, then the color index defaults to a value of 1.

Parameters

index — **specified by user, fullword integer**
Color index (>=0).

Error Codes

5   FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)

GPSPR - Set Surface Properties

GPSPR (*amb*, *diff*, *spec*, *exp*, *trans*)

Purpose

Use **GPSPR** to insert a Set Surface Properties structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Surface Properties structure element depending on the current edit mode.

During structure traversal, this structure element specifies the coefficients and exponents which the graPHIGS API uses in calculating lighting and transparency effects.

If face distinguish mode (**GPFDMO**) is set to `1=NONE`, then the graPHIGS API uses these values to calculate the lighting and transparency effects on both the front and back facing portions of a surface. If face distinguish mode is set to `2=COLOR_SURFACE_PROPERTIES`, then the graPHIGS API uses these values to calculate the effects on only the front facing portions of a surface.

The traversal default for the coefficients and exponent for the surface properties are as follows:
*   *amb* = 1.0 (ambient reflection coefficient)
*   *diff* = 1.0 (diffuse reflection coefficient)

- *spec* = 1.0 (specular reflection coefficient)
- *exp* = 0.0 (specular reflection exponent) (i.e., no specular effect)
- *trans* = 0.0 (transparency coefficient) (i.e., opaque)

The transparency mode (**GPXVR**) for the view must be set to a value other than `1=NONE` for the graPHIGS API to use the specified transparency coefficient.

The current transparency coefficient in the graPHIGS API Traversal State List is also set by the transparency coefficient of the Set Transparency Coefficient (**GPTCO**) subroutine.

Parameters

amb — **specified by user, short floating-point number**
    Ambient reflection coefficient (0<= *amb*<=1).

diff — **specified by user, short floating-point number**
    Diffuse reflection coefficient (0<= *diff*<=1).

spec — **specified by user, short floating-point number**
    Specular reflection coefficient (0<= *spec*<=1).

exp — **specified by user, short floating-point numbers**
    Specular reflection exponent (>=0).

trans — **specified by user, short floating-point number**
    Transparency coefficient (0<= *trans*<=1).

GPTCAC - Set Trimming Curve Approximation Criteria

> **GPTCAC (*criteria*, *ctrlval1*, *ctrlval2*, *ctrlval3*)**

Purpose

Use **GPTCAC** to insert a Set Trimming Curve Approximation Criteria structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Trimming Curve Approximation Criteria structure element depending on the current edit mode.

This structure element enables the application to control the tessellation of the trimming curve as well as the surface in the area of the curve when rendering subsequent trimmed surface primitives during structure traversal.

Depending on the criteria selected, the graPHIGS API only uses the control values or uses the control values in conjunction with the tessellation vector in the trimmed surface primitive definition to determine how the trimming curve is tessellated.

The traversal default for trimming curve approximation criteria is `1=WORKSTATION_DEPENDENT` with the control value (*ctrlval1*), the *u* control value (*ctrlval2*), and *v* control value (*ctrlval3*) all set to a value of 1.0.

If the workstation does not support the specified trimming curve approximation criteria, then the default trimming curve criteria is `1=WORKSTATION_DEPENDENT` with *ctrlval1*, *ctrlval2*, and *ctrlval3* all set to a value of 1.0.

For information on trimmed surfaces and how trimming curve approximation criteria is applied, see *The graPHIGS Programming Interface: Understanding Concepts*.

Parameters

criteria — **specified by user, fullword integer**
> Curve approximation criteria (`1=WORKSTATION_DEPENDENT`, `3=CONSTANT_SUBDIVISION_BETWEEN_KNOTS`, `8=VARIABLE_SUBDIVISION_BETWEEN_KNOTS`).

ctrlval1 — **specified by user, short floating-point number**
> Control value (>=0).

ctrlval2 — **specified by user, short floating-point number**
> *u*-Control value (>=0).

ctrlval3 — **specified by user, short floating-point number**
> *v*-Control value (>=0).

GPTCO - Set Transparency Coefficient

GPTCO (*coeff*)

Purpose

Use **GPTCO** to insert a Set Transparency Coefficient structure element into the open structure following the element pointer, or to replace the element pointed at by the element pointer with a Set Transparency Coefficient structure element, depending upon the current edit mode.

During traversal, the value of *coeff* specifies the source transparency coefficient of subsequent primitives. The use of the transparency coefficient depends on the Transparency Processing Mode of the view table entry.

If face distinguish mode (**GPFDMO**) is `1=NONE`, then the graPHIGS API uses this value to calculate the transparency effects on both front and back facing portions of area primitives. If face distinguish mode is `2=COLOR_SURFACE_PROPERTIES`, then graPHIGS API uses this value to calculate the transparency effects on only front facing portions of area primitives.

The current transparency coefficient in the graPHIGS API Traversal State List is also set by the transparency coefficient of the Set Surface Properties (**GPSPR**) subroutine.

The traversal default for the transparency coefficient value is 0.0.

Parameters

coeff — **specified by user, short floating-point number**
 Transparency coefficient (0.0<=*coeff*<=1.0).

Error Codes

5 FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)

GPTXAL - Set Text Alignment

GPTXAL (*horiz, vert*)

Purpose

Use **GPTXAL** to insert a Set Text Alignment structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Text Alignment structure element depending on the current edit mode.

At structure traversal time, the graPHIGS API uses the specified alignment in this structure element to render all subsequent geometric text primitives. This setting affects the manner in which the graPHIGS API positions the geometric text extent rectangle in relation to the text position.

The traversal default for geometric text horizontal and vertical alignment is `1=NORMAL`.

If the workstation does not support the specified text alignment values, then the text alignment defaults to `1=NORMAL` for both horizontal and vertical text alignment.

Parameters

horiz — **specified by user, fullword integer**
    Horizontal alignment (1=NORMAL, 2=LEFT_ALIGN, 3=CENTER, 4=RIGHT_ALIGN).

vert — **specified by user, fullword integer**
    Vertical alignment (1=NORMAL, 2=TOP, 3=CAP, 4=HALF, 5=BASE, 6=BOTTOM).

GPTXCD - Set Text Color Direct

GPTXCD (*color*)

Purpose

Use **GPTXCD** to insert a Set Text Color Direct structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Text Color Direct structure element depending on the current edit mode.

This structure element specifies the direct color values that the graPHIGS API uses to render the subsequent text primitives. At structure traversal time, the graPHIGS API uses these values to render all subsequent annotation and geometric text primitives when the text color aspect source flag is set to `2=INDIVIDUAL`.

This attribute sets the same traversal state as the Set Text Color Index (**GPTXCI**) subroutine. The traversal default is the content of entry 1 of the rendering color table.

Parameters

color **— specified by user, 3 short floating-point numbers**
  Three color components of the current direct color model in the graPHIGS API state list
  (0.0<=component<=1.0).

Error Codes

GPTXCI - Set Text Color Index

GPTXCI (*index*)

Purpose

Use **GPTXCI** to insert a Set Text Color Index structure element into the open structure following the
element pointer or to replace the element pointed at by the element pointer with a Set Text Color Index
structure element depending on the current edit mode.

This structure element specifies an entry in the workstation's rendering color table that defines the color
that the graPHIGS API uses to render all subsequent annotation and geometric text primitives. At structure
traversal time, the graPHIGS API uses this to render the text primitives when the text color aspect source
flag is set to `2=INDIVIDUAL`.

This attribute sets the same traversal state as the Set Text Color Direct (**GPTXCD**) subroutine. The
traversal default for text color is a color index value of 1.

If the workstation does not support the specified text color index, then the color index defaults to a value of
1.

Parameters

index **— specified by user, fullword integer**
  Color index (>=0).

GPTXFO - Set Text Font

GPTXFO (*font*)

Purpose

Use **GPTXFO** to insert a Set Text Font structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Text Font structure element depending on the current edit mode.

This structure element specifies a font identifier that the graPHIGS API uses to render all subsequent annotation and geometric text primitives. At structure traversal time, the graPHIGS API uses this identifier when the text font aspect source flag is set to 2=INDIVIDUAL.

The traversal default for annotation and geometric text font is font 1.

Parameters

font — **specified by user, fullword integer**
          Specifies the text font to be used (>=1).

          If a value is encountered that is unavailable (unsupported or inactive), font 1 of that character set is substituted. If that font is unavailable, font 1 of the primary character set is substituted at the same precision.

          For a complete list of supported fonts, see *The graPHIGS Programming Interface: Technical Reference*. For specific workstation support, use Inquiry programming subroutines (Chapter 16. "Inquire Subroutines" or see *The graPHIGS Programming Interface: Technical Reference*).

GPTXI - Set Text Index

GPTXI (*index*)

Purpose

Use **GPTXI** to insert a Set Text Index structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Text Index structure element depending on the current edit mode.

This structure element specifies an entry in the workstation's text bundle table. The entry contains attribute settings for text font, text precision, character expansion factor, character spacing, and color. At structure traversal time, the graPHIGS API uses these attribute settings to render all subsequent annotation and geometric text primitives for those attributes that have an aspect source flag set to 1=BUNDLED.

The traversal default text index value is 1.

If the workstation does not support the specified text index, then the text index defaults to a value of 1.

Parameters

index — **specified by user, fullword integer**
    Text bundle table index (>=1).

Error Codes

GPTXPR - Set Text Precision

GPTXPR (*prec*)

Purpose

Use **GPTXPR** to insert a Set Text Precision structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Text Precision structure element depending on the current edit mode.

The text precision specifies which attributes apply to annotation and geometric text primitives and the manner in which the graPHIGS API uses them. At structure traversal time, the graPHIGS API uses this precision when the text precision aspect source flag is set to 2=INDIVIDUAL.

The traversal default for text precision is 1=STRING_PREC.

If the workstation does not support the specified text precision, then the graPHIGS API uses the highest available precision in the font instead.

Parameters

prec — **specified by user, fullword integer**
Text precision (1=STRING_PREC, 2=CHAR_PREC, 3=STROKE_PREC).

The following figure describes the attributes and precision for geometric text:

```
                                     Geometric Text Attributes

                                                            CHARACTER

GPTXPT - Set Text Path

GPTXPT (*path*)

Purpose

Use **GPTXPT** to insert a Set Text Path structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Text Path structure element depending on the current edit mode.

This structure element specifies the writing direction of the text string relative to the Character Up Vector. At structure traversal time, the graPHIGS API uses this path value to render all subsequent geometric text primitives.

The traversal default for text path is `1=RIGHT`.

If the workstation does not support the specified text path value, then the text path defaults to `1=RIGHT`.

Parameters

path — **specified by user, fullword integer**
> Specifies text path (`1=RIGHT`, `2=LEFT`, `3=UP`, `4=DOWN`).

Error Codes

5   FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)

GPVWI - Set View Index

GPVWI (*index*)

Purpose

Use **GPVWI** to insert a Set View Index structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set View Index structure element depending on the current edit mode.

During structure traversal, this structure element specifies an entry in the workstation view table. The entry contains attribute settings for the view orientation matrix, view mapping matrix, viewport boundaries, and viewport clipping indicators. At structure traversal time, the graPHIGS API uses these attribute settings to render all subsequent output primitives.

The traversal default for the view index is entry 0 of the workstations's view table.

Parameters

index — **specified by user, fullword integer**
> An index which specifies an entry into the workstation's view table.

Error Codes

5 FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)

59 VIEW INDEX VALUE < ZERO

GPZBM - Set Z-Buffer Protect Mask

GPZBM (*mask*)

Purpose

Use **GPZBM** to insert a Set Z-Buffer Protect Mask structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Z-Buffer Protect Mask structure element depending on the current edit mode.

During structure traversal, this structure elements sets the Z-Buffer Protect Mask entry of the graPHIGS API traversal state to the value specified by the parameter.

The mask value specifies a write-protect mask for the z-buffer to inhibit writing into the z-buffer during the rendering of output primitives. If a z-buffer is not present on the workstation, then this attribute is ignored.

The mask is a 32-bit integer. The mask supports two values:
- All bits 0 - This value allows updates to the z-buffer.
- All bits 1 - This value prohibits updates to the z-buffer.

If the *mask* value is not all zeros, then it is processed as if a *mask* value of all ones had been specified.

The traversal default for the z-buffer protect mask is a value of 0 for all 32 bits.

GPZBM is identified as GSE 1009.

> **Note:** Not all GSEs are supported on all workstations. Use the Inquire List of Generalized Structure Elements (**GPQGSE**) subroutine to determine the GSEs which are supported by an open workstation. See also the workstation descriptors in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

mask **— specified by user, fullword integer**
> z-buffer protect mask. A mask of 0 for all 32 bits allows the application to update the z-buffer. A mask of 1 for all 32 bits prohibits updates to the z-buffer.

Chapter 5. Miscellaneous Structure Elements

This section describes subroutines which generate structure elements which are *not* related to primitives or primitive attributes. The subroutines in this section generate structure execution and return elements and application data elements used to store application specific information.

GPCEXS - Conditional Execute Structure

GPCEXS (*mask*, *crit*, *mode*, *strid*)

Purpose

Use **GPCEXS** to insert a Conditional Execute Structure structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Conditional Execute Structure structure element depending on the current edit mode.

If the specified structure identifier does not exist, then the graPHIGS API creates a new empty structure.

If the current condition flags selected by the *mask* parameter satisfy the specified criteria, then the graPHIGS API executes the specified structure according to the specified execution mode. Otherwise, no action is taken, and the element count is incremented.

The condition flag is a 32-bit bit string. Each bit is defined as follows:

```
0                          15  16                         29  30     31
---------------------------------------------------------------------
|                          |                          | cull  | prune |
|   reserved for application |        reserved         | flag  | flag  |
---------------------------------------------------------------------
High bit                                                    Low bit
```
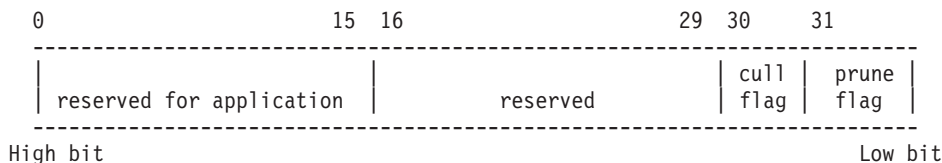

GPCEXS is identified as GSE 1004.

> **Note:** Not all GSEs are supported on all workstations. Use the Inquire List of Generalized Structure Elements (**GPQGSE**) inquiry subroutine to determine the GSEs which are supported by an open workstation. See also the workstation descriptors in *The graPHIGS Programming Interface: Technical Reference (POWER-based System Only)*.

Parameters

mask — **specified by user, fullword integer**
>   32-bit mask specifying flags to be tested in the current condition flag.

crit — **specified by user, fullword integer**
>   Criteria to be satisfied when the set of flags in the specified mask is tested against the current condition flag (1=ALL_ONES, 2=ALL_ZEROS, 3=NOT_ALL_ONES, 4=NOT_ALL_ZEROS).

mode — **specified by user, fullword integer**
>   Execution mode of the child structure (1=NORMAL).

strid — **specified by user, fullword integer**
>   Structure identifier.

Error Codes

GPCOND - Set Condition

> GPCOND (*on*, *off*)

Purpose

Use **GPCOND** to insert a Set Condition structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Set Condition structure element depending on the current edit mode.

During structure traversal, this structure element modifies the current condition flag as specified by the parameter. The graPHIGS API uses the condition flag when processing subsequent conditional execute structure and conditional return elements. Flags specified in the on-flag (*on*) parameter are turned on and flags specified in the off-flag (*off* parameter) are turned off in the condition flag. Mathematically, the current condition flag becomes ([current-flag] or [on-flag]) and (NOT[off-flag]).

The condition flag is a 32-bit bit string. Each bit is defined as follows:

```
0                       15  16                   29  30     31
  ---------------------------------------------------------------------
 |                         |                      | cull  | prune |
 |  reserved for application |     reserved       | flag  | flag  |
  ---------------------------------------------------------------------
High bit                                              Low bit
```
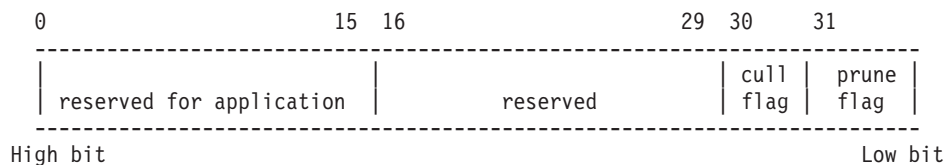

GPCOND is identified as GSE 1003.

> **Note:** Not all GSEs are supported on all workstations. Use the Inquire List of Generalized Structure Elements (**GPQGSE**) inquiry subroutine to determine the GSEs supported by an open workstation. See also the workstation descriptors described in *The graPHIGS Programming Interface: Technical Reference (POWER-based System Only)*.

Parameters

on — **specified by user, fullword integer**
On-flag indicates the bits in the current condition flag to be set to one.

off — **specified by user, fullword integer**
Off-flag indicates the bits in the current condition flag to be set to zero.

Error Codes

5   FUNCTION REQUIRES STATE STOP OR NROP (NOT
                                                                     STCL)

GPCRET - Conditional Return

GPCRET (_mask_**,** _crit_**)**

Purpose

Use **GPCRET** to insert a Conditional Return structure element into the open structure following the
element pointer or to replace the element pointed at by the element pointer with a Conditional Return
structure element depending on the current edit mode.

If the current condition flags selected by the _mask_ parameter satisfy the specified criteria, then the
traversal of the current structure is terminated and the traversal of the parent structure is resumed.
Otherwise, no action is taken, and the element count is incremented.

The condition flag is a 32-bit bit string. Each bit is defined as follows:

```
 0                              15  16                         29  30      31
 --------------------------------------------------------------------------
 |                              |                            | cull  | prune |
 |  reserved for application    |          reserved          | flag  | flag  |
 --------------------------------------------------------------------------
High bit                                                        Low bit
```
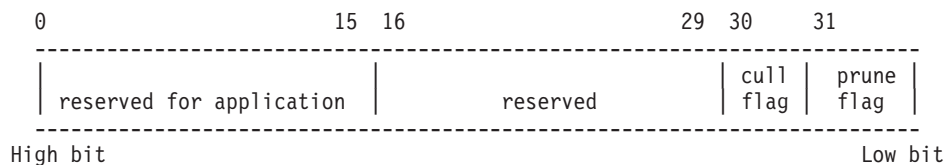

GPCRET is identified as GSE 1005.

> **Note:** Not all GSEs are supported on all workstations. Use the Inquire List of Generalized Structure
> Elements (**GPQGSE**) inquiry subroutine to determine the GSEs supported by an open workstation.
> See also the workstation descriptors described in _The graPHIGS Programming Interface: Technical_
> _Reference (POWER-based System Only)_.

Parameters

mask **— specified by user, fullword integer**
      Mask specifying flags to be tested in the current condition flag.

crit **— specified by user, fullword integer**
      Criteria to be satisfied when the set of flags in the specified mask is tested against the current
      condition flag (1=ALL_ONES, 2=ALL_ZEROS, 3=NOT_ALL_ONES, 4=NOT_ALL_ZEROS).

GPEXST - Execute Structure

GPEXST (*strid*)

Purpose

Use **GPEXST** to insert an Execute Structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with an Execute Structure element depending on the current edit mode. If the specified structure does not exist, then the graPHIGS API creates a new empty structure.

This element is one of two different execute structure-type elements that can exist in a structure. The other execute structure-type element is the Conditional Execute Structure (**GPCEXS**) element.

Traversal of the structure in which the Execute Structure element exists causes invocation of the target structure as soon as the Execute Structure element is encountered. Although the graPHIGS API does not allow recursive structure networks, no error is generated by the creation of such a network. The graPHIGS API only generates an error when an attempt is made to execute the open structure. The behavior of the graPHIGS API when traversing a recursive structure network is undefined.

Parameters

strid — **specified by user, fullword integer**
Structure identifier invoked at traversal time.

Error Codes

5 FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)

125 ATTEMPTING TO EXECUTE THE OPEN STRUCTURE

Related Subroutines

GPINAD - Insert Application Data

GPINAD (*length*, *data*)

Purpose

Use **GPINAD** to insert an application data structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with an Insert Application Data structure element depending on the current edit mode.

This subroutine allows the insertion of application specific data into a structure element. This data is ignored during structure traversal.

Parameters

length — **specified by user, fullword integer**
> Length of application data in bytes(>=0).

data — **specified by user, variable length data**
> Application data to be placed in the element.

Error Codes

5   FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)

509   DATA LENGTH VALUE < ZERO OR REQUIRED LENGTH

GPTEX2 - Test Extent 2

GPTEX2 (*point1*, *point2*, *index*)

Purpose

Use **GPTEX2** to insert a Test Extent 2 structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Test Extent 2 structure element depending on the current edit mode.

The Test Extent 2 structure element is a short hand form of the Test Extent 3 structure element. During traversal the two endpoints of this element are expanded to 3D by supplying zero z values and then are treated the same as Test Extent 3. (See the Test Extent 3 [**GPTEX3**] subroutine (page GPTEX3 - Test Extent 3) for further details).

GPTEX2 is identified as GSE 1007.

Note: Not all GSEs are supported on all workstations. Use the Inquire List of Generalized Structure Elements (**GPQGSE**) inquiry subroutine to determine the GSEs supported by an open workstation. See also the workstation descriptors in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

point1 — **specified by user, 2 short floating-point numbers (MC)**
>   *x*, *y* coordinates of one end point of the extent box's diagonal.

point2 — **specified by user, 2 short floating-point numbers (MC)**
>   *x*, *y* coordinates of another end point of the extent box's diagonal.

index — **specified by user, fullword integer**
>   Cull size index specifying an entry in the workstation's cull size table (>=1).

Error Codes

5   FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)

278   CULL SIZE INDEX < ONE

RCP code

201331719 (X'0C001407')

GPTEX3 - Test Extent 3

GPTEX3 (*point1*, *point2*, *index*)

Purpose

Use **GPTEX3** to insert a Test Extent 3 structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Test Extent 3 structure element depending on the current edit mode.

This structure element modifies the cull flag and prune flag within the current condition flags. These flags are used when processing subsequent conditional execute structure and conditional return elements.

During structure traversal, this element sets the prune flag (31st bit) and cull flag (30th bit) of the current condition flags in the graPHIGS traversal state list as follows:

1. Transform the specified extent box by the current modelling and viewing transformation but applying only *z* clip of the viewing transformation. The window clipping of the viewing and workstation transformation is not applied.

2. Determine the smallest box whose edges are parallel to the NPC axes and which surrounds the remaining extent box after *z* clipping.

3. If the box is completely outside the viewport of the view or completely outside of the workstation window, set the 31st bit (prune flag) to a value of one; otherwise set it to zero.

4. Transform the box by the workstation transformation and map it onto two-dimensional-DC using a parallel projection.

5. If the diagonal of the mapped rectangle is shorter than the cull size threshold specified by the cull size index, set the 30th bit (cull flag) to a value of one; otherwise set it to zero.

The condition flag is a 32-bit bit string. Each bit is defined as follows:

```
0                        15  16                    29  30     31
 ---------------------------------------------------------------------
|                          |                      | cull  | prune  |
|  reserved for application |     reserved        | flag  | flag   |
 ---------------------------------------------------------------------
 High bit                                               Low bit
```
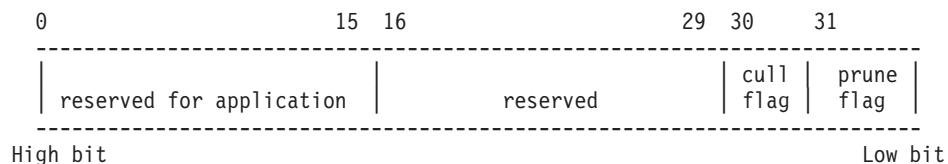

If the workstation does not support the specified cull size index or the specified index is outside the allowable range, then the cull size index defaults to a value of 1.

GPTEX3 is identified as GSE 1006.

> **Note:** Not all GSEs are supported on all workstations. Use the Inquire List of Generalized Structure Elements (**GPQGSE**) inquiry subroutine to determine the GSEs supported by an open workstation. See also the workstation descriptors in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

point1 — **specified by user, 3 short floating-point numbers (MC)**
> *x*, *y*, and *z* coordinates of one end point of the extent box's diagonal.

point2 — **specified by user, 3 short floating-point numbers (MC)**
> *x*, *y*, and *z* coordinates of the other end point of the extent box's diagonal.

index — **specified by user, fullword integer**
> Cull size index specifying an entry of the cull size table (>=1).

GPWDO - Workstation-Dependent Output

GPWDO (*length***, ***data***)**

Purpose

Use **GPWDO** to insert a Workstation-Dependent Output structure element into the open structure following the element pointer or to replace the element pointed at by the element pointer with a Workstation-Dependent Output structure element depending on the current edit mode.

During structure traversal, the workstation performing the traversal outputs the data directly. The graPHIGS API does not check the validity of the data. It is the application's responsibility to ensure that the data is valid (e.g., proper length(s), identifiers, padding, etc.). When character encoding, floating-point, and/or byte ordering differences exist between the target workstation and the application environment, the application must ensure the validity of this data also. For information on how the application can ensure the validity of this data, see the Convert Data (**GPCVD**) subroutine.

Currently, this subroutine is only supported by CGM workstations. This subroutine is ignored on all other workstations. For more information on CGM data, see "CGM Workstation" in *The graPHIGS Programming Interface: Technical Reference*.

GPWDO is identified as GSE 1010.

>**Note:** Not all GSEs are supported on all workstations. Use the Inquire List of Generalized Structure Elements (**GPQGSE**) inquiry subroutine to determine the GSEs supported by an open workstation. See also the workstation descriptors in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

length **— specified by user, fullword integer**
>Length of output data in bytes (>=0).

data **— specified by user, variable length data**
>Data that the application sends as output to the workstation.

Error Codes

5   FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)

Chapter 6. Structure Operations

The subroutines included in this section let your application program manipulate structures and their contents. Operations performed by these subroutines include:

- creating-deleting a structure
- creating structure hierarchies
- opening a structure for modification
- editing structure content

After opening a structure, the element pointer normally points to the last element in the structure. In order to modify a structure, the element pointer can be repositioned to a desired element. If the edit mode is set for insertion, then an element is inserted in the open structure following the element pointer. Otherwise, if the edit mode is set for replacement, then an element replaces the element at the current element pointer.

When editing structure content, the structure store containing the structures must first be selected by the application by using the Select Structure Store (**GPSSS**) subroutine.

In order to have structure data displayed on the workstation, the structure store containing the structures must first be associated to the specified workstation by the application by using the Associate Structure Store with Workstation (**GPASSW**) subroutine.

GPASSW - Associate Structure Store with Workstation

GPASSW (*wsid*, *ssid*)

Purpose

Use **GPASSW** to associate a structure store to all views on a workstation. This association gives the workstations the ability to associate structures from the specified structure store to the workstation or to views in the workstation (a necessary step to having structures displayed). If the workstation currently has a structure store associated to it, then the graPHIGS API disassociates the structure store from the workstation and associates the specified structure store.

Disassociating a structure store from a workstation is similar to invoking the Disassociate All Roots from Workstation (**GPDARW**) subroutine. In addition, **GPASSW** does not allow the graPHIGS API to associate any of the structures in the structure store to a workstation or view on the workstation until that structure store is once again associated to the workstation.

If a structure store is selected when the Open Workstation (**GPOPWS**) subroutine is invoked, then the subroutine automatically associates the selected structure store to the workstation. Use **GPASSW** at a later time to associate a different structure store to the workstation. If your application does not select a structure store when invoking the Open Workstation (**GPOPWS**) subroutine, or your application used the Create Workstation (**GPCRWS**) subroutine to open a workstation, then your application needs to explicitly associate a structure store to the workstation before the graPHIGS API can add the structures to views and then display them.

A structure store has a limit on the number of workstations to which it can associate. This limit applies to all application processes attached to the structure store resource. To determine the limit, use the Inquire List of Available Workstation Types on Nucleus (**GPQWTN**) subroutine. The graPHIGS API issues error message 226 if this limit is exceeded.

Parameters

wsid — **specified by user, fullword integer**
    Workstation identifier.

ssid — **specified by user, fullword integer**
    Structure store identifier.

Error Codes

25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
215	SPECIFIED RESOURCES DO NOT EXIST ON THE SAME NUCLEUS
222	SPECIFIED STRUCTURE STORE DOES NOT EXIST
226	MAXIMUM NUMBER OF SIMULTANEOUS ASSOCIATED WORKSTATIONS EXCEEDED

RCP code

201333506 (X'0C001B02')

GPCCM - Set Convexity Checking Mode

GPCCM (*mode*)

Purpose

Use **GPCCM** to set the current convexity checking mode in the graPHIGS API state list.

Your application can set this mode to `1=OFF` or `2=ON`. If the convexity checking mode is set to `2=ON`, then the graPHIGS API determines if subsequent primitives with indeterminate convexity are convex for the following primitives:

GPPG2	Polygon 2
GPPG3	Polygon 3
GPPGD2	Polygon 2 With Data
GPPGD3	Polygon 3 With Data

The graPHIGS API then stores the convexity determination as part of the structure element, which can enhance traversal performance.

The default convexity checking mode is `1=OFF`.

Parameters

mode — **specified by user, fullword integer**
    Convexity checking mode (`1=OFF`, `2=ON`).

Error Codes

98	CONVEXITY CHECKING MODE IS INVALID

Related Subroutines

GPPG2	Polygon 2
GPPG3	Polygon 3
GPPGD2	Polygon 2 With Data
GPPGD3	Polygon 3 With Data

RCP code

201330966 (X'0C001116')

GPCEDT - Conditional Editing

GPCEDT (*flag*)

Purpose

Use **GPCEDT** to begin and end conditional structure editing in the current open structure.

Once conditional editing begins, all affected structure operation subroutine calls (i.e., all structure store subroutine calls except for inquiry subroutines and those subroutines which do not require an open structure) are performed as usual until either the conditional editing is ended or your application closes the structure or until an error occurs (except for errors caused by inserting or replacing structure elements). When an error occurs while conditional editing is active, the graPHIGS API ignores all subsequent editing operations until either the conditional editing is ended or your application closes the structure store.

Structure operations that temporarily close an open structure, such as the Delete Structure (**GPDLST**) subroutine, do not affect the conditional editing mode.

Parameters

flag — **specified by user, fullword integer**
Conditional edit flag (1=START, 2=END).

Error Codes

4	FUNCTION REQUIRES STATE STOP
137	VALUE OF CONDITIONAL EDIT FLAG IS INVALID

RCP code

201331462 (X'0C001306')

GPCLST - Close Structure

GPCLST

Purpose

Use **GPCLST** to close a structure in the currently selected structure store. The current structure state is set to Structure Closed (STCL).

If your application started conditional editing, then the graPHIGS API stops conditional editing.

Once closed, your application cannot insert or replace structure elements in the structure until the structure is opened. Also, the structure store containing the structure being closed becomes available to be updated by other application processes attached to the structure store.

Parameters

None

Error Codes

4	FUNCTION REQUIRES STATE STOP

Related Subroutines

GPCEDT	Conditional Editing
GPOPST	Open Structure

RCP code

201331458 (X'0C001302')

GPCPER - Copy Element Range

GPCPER (*strid*, *elem1*, *elem2*)

Purpose

Use **GPCPER** to copy a range of elements from a specified structure and to insert the range of elements into the open structure following the current element pointer. The element pointer moves to the last element copied into the open structure.

- If the value for *elem1* is greater than the value for *elem2*, then the values are swapped. (The element range always starts at the lowest value and ends at the highest value.)
- If both values point beyond the last element of the specified structure or if both values are less than one, then the graPHIGS API does not perform the copy.
- If one of the values is less than one, then the value defaults to a value of one.
- If one of the values is greater than the number of elements in the specified structure, then the element number of the last element in that structure is used instead.

The value of the edit mode set by **GPEDMO** does not affect the functionality of this subroutine.

If the elements to be copied contain an execute structure-type element that references the open structure, then the graPHIGS API issues an error message and does not perform the copy.

Parameters

strid — **specified by user, fullword integer**
  Identifier of the structure which has elements that are copied.

elem1 — **specified by user, fullword integer**
  Element number of the first element to copy.

elem2 — **specified by user, fullword integer**
  Element number of the last element to copy.

Error Codes

4	FUNCTION REQUIRES STATE STOP
125	ATTEMPTING TO EXECUTE THE OPEN STRUCTURE

Related Subroutines

GPCEXS	Conditional Execute Structure
GPCPST	Copy Structure
GPEXST	Execute Structure

RCP code

201338626 (X'0C002F02')

GPCPST - Copy Structure

GPCPST (*strid*)

Purpose

Use **GPCPST** to copy the elements from the specified structure and to insert the elements into the open structure following the current element pointer. The element pointer moves to the last element copied into the open structure.

The value of the edit mode set by **GPEDMO** does not affect the functionality of this subroutine.

If the structure you copy references the open structure (by the use of an execute structure-type element), then the graPHIGS API issues an error message and does not perform the copy.

Parameters

strid **— specified by user, fullword integer**
> Identifier of the structure whose contents are copied.

Error Codes

4	FUNCTION REQUIRES STATE STOP
125	ATTEMPTING TO EXECUTE THE OPEN STRUCTURE

Related Subroutines

GPCEXS	Conditional Execute Structure
GPEXST	Execute Structure

RCP code

201338625 (X'0C002F01')

GPCSI - Change Structure Identifier

GPCSI (*ostrid*, *rstrid*)

Purpose

Use **GPCSI** to change the identifier of a structure (called the *original structure*) to a specified structure identifier (called the *resulting structure*). This subroutine does not affect execute structure-type elements that reference the original structure.

If the identifier of the original structure is the same as the identifier of the resulting structure and the structure exists, then no action occurs. If the structure does not exist, however, then the graPHIGS API creates an empty structure with the identifier of the resulting structure.

If the original structure does not exist, then the graPHIGS API empties the resulting structure. If the original structure does exist, then the contents of the original structure replace the contents of the resulting structure and the graPHIGS API empties the original structure. If the original structure references the resulting structure, then the graPHIGS API issues an error message and does not perform the change.

At the completion of this subroutine call, the system deletes the original structure *unless* the original structure is the open structure, is referenced by any other structure or is associated to a view or workstation.

If the *original* structure is the open structure, then the graPHIGS API sets the current element pointer to zero. If the *resulting* structure is the open structure, then the graPHIGS API sets the current element pointer to point to the last element in the structure.

Parameters

ostrid **— specified by user, fullword integer**
> Original structure identifier.

rstrid — **specified by user, fullword integer**
        Resulting structure identifier.

Error Codes

12	FUNCTION REQUIRES STATE SSSL

GPCSIR - Change Structure Identifier and References

GPCSIR (*ostrid*, *rstrid*)

Purpose

Use **GPCSIR** to change all execute structure-type elements which reference a structure (called the *original structure*) with elements which reference a specified structure (called the *resulting structure*) and then change the identifier of the original structure with that of the resulting structure. The effect of this subroutine is as though the application called the Change Structure References (**GPCSRS**) subroutine followed by a call to the Change Structure Identifier (**GPCSI**) subroutine.

If the original structure references the resulting structure, then the graPHIGS API issues an error and does not perform the change.

Parameters

ostrid — **specified by user, fullword integer**
        Original structure identifier.

rstrid — **specified by user, fullword integer**
        Resulting structure identifier.

Error Codes

12	FUNCTION REQUIRES STATE SSSL
129	ATTEMPTING TO HAVE THE RESULTING STRUCTURE EXECUTE ITSELF

Related Subroutines

GPCSI	Change Structure Identifier
GPCSRS	Change Structure References

GPCSRS - Change Structure References

GPCSRS (*ostrid*, *rstrid*)

Purpose

Use **GPCSRS** to change all execute structure-type elements which reference a structure (called the *original structure*) with elements which reference a specified structure (called the *resulting structure*). This subroutine does not affect any references to the resulting structure that existed before the call.

If the identifier of the original structure and the identifier of the resulting structure are identical, then no action occurs. If the resulting structure references the original structure, then the graPHIGS API issues an error message and does not perform the change.

If there are references to the original structure and the resulting structure does not exist, then the graPHIGS API creates an empty structure with the identifier of the resulting structure. If the original structure does not exist or if there are no references to the original structure, then no action occurs.

If the original structure and resulting structure are both associated to a workstation (or a view), then the original structure is disassociated and the resulting structure remains associated to the workstation (or the view). If the original structure is associated to a workstation (or view) but the resulting structure is not associated, then the original structure is disassociated and the resulting structure is associated to the workstation, or in the case of a view, the original structure is disassociated and the resulting structure is associated to the view with the same priority that the original structure had.

Parameters

ostrid — **specified by user, fullword integer**
      Original structure identifier.

rstrid — **specified by user, fullword integer**
      Resulting structure identifier.

201343502(X'0C00420E')

GPDELB - Delete Element Between Labels

> **GPDELB (*label1*, *label2*)**

Purpose

Use**GPDELB** to delete all elements from the open structure between, but not including, the two specified labels. After deletion, the element pointer moves to the element specified by the label identifier 1(*label1*).

Starting from the current position of the element pointer, the system searches for label identifier 1. When the end of the structure is reached, the search continues at element number 1.Beginning with the original position of the element pointer, the system then searches for label identifier 2.When the end of the structure is reached, the system continues the search at element number 1. If the system cannot locate either label, then the graPHIGS API issues an error.

Parameters

label1 — **specified by user, fullword integer**
     Label identifier 1.

label2 — **specified by user, fullword integer**
     Label identifier 2.

Error Codes

4	FUNCTION REQUIRES STATE STOP
130	LABEL IDENTIFIER CANNOT BE FOUND IN THE OPEN STRUCTURE

201332481 (X'0C001701')

___

GPDLEG - Delete Element Group

GPDLEG (*label1*, *label2*, *option*)

Purpose

Use **GPDLEG** to delete all elements from the open structure between the two specified labels. There are two methods that you can use to search for the labels: the graPHIGS API method and the ISO PHIGS method. Specify the method using the search and deletion option field.

graPHIGS API method: If the *option* parameter is 1=START_AT_CURRENT_ELEMENT_NEITHER_DELETED, 2=START_AT_CURRENT_ELEMENT_BOTH_DELETED, 3=START_AT_CURRENT_ELEMENT_FIRST_DELETED, 4=START_AT_CURRENT_ELEMENT_SECOND_DELETED, then starting from the current position of the element pointer, the graPHIGS API searches for label identifier 1. The system then searches for label identifier 2, starting from the position of the label now found.

ISO PHIGS method: If the *option* parameter is 5=START_AT_NEXT_ELEMENT_NEITHER_DELETED, 6=START_AT_NEXT_ELEMENT_BOTH_DELETED, 7=START_AT_NEXT_ELEMENT_FIRST_DELETED, 8=START_AT_NEXT_ELEMENT_SECOND_DELETED, then starting from the element immediately *after* the current position of the element pointer, the graPHIGS API searches for label identifier 1. The system then searches for label identifier 2, starting from the label element immediately *after* the label now found.

Regardless of the method used to find the labels, if the system reaches the end of the structure before both labels are found, the graPHIGS API issues an error and the current element pointer remains at the original position before this subroutine was called.

For the deletion process, the application can control whether or not the specified label elements are also deleted. When the *option* parameter is 1=START_AT_CURRENT_ELEMENT_NEITHER_DELETED (when using the graPHIGS API method) or 5=START_AT_NEXT_ELEMENT_NEITHER_DELETED (when using the ISO PHIGS method) neither of the two labels are deleted.

When the *option* parameter is 2=START_AT_CURRENT_ELEMENT_BOTH_DELETED (graPHIGS API) or 6=START_AT_NEXT_ELEMENT_BOTH_DELETED (ISO PHIGS) then both of the labels are deleted.

When *option* is 3=START_AT_CURRENT_ELEMENT_FIRST_DELETED (graPHIGS API) or 7=START_AT_NEXT_ELEMENT_FIRST_DELETED (ISO PHIGS), only the first label is deleted.

When *option* 4=START_AT_CURRENT_ELEMENT_SECOND_DELETED (graPHIGS API) or 8=START_AT_NEXT_ELEMENT_SECOND_DELETED (ISO PHIGS), only the second label is deleted.

After deletion, the element pointer is positioned at the element immediately preceding the deleted elements.

Parameters

label1 — **specified by user, fullword integer**
    Label identifier 1.

label2 — **specified by user, fullword integer**
    Label identifier 2.

option — **specified by user, fullword integer**
    Label deletion option (1=START_AT_CURRENT_ELEMENT_NEITHER_DELETED,
    2=START_AT_CURRENT_ELEMENT_BOTH_DELETED, 3=START_AT_CURRENT_ELEMENT_FIRST_DELETED,
    4=START_AT_CURRENT_ELEMENT_SECOND_DELETED, 5=START_AT_NEXT_ELEMENT_NEITHER_DELETED,
    6=START_AT_NEXT_ELEMENT_BOTH_DELETED, 7=START_AT_NEXT_ELEMENT_FIRST_DELETED,
    8=START_AT_NEXT_ELEMENT_SECOND_DELETED).

Error Codes

4	FUNCTION REQUIRES STATE STOP

GPDLER - Delete Element Range

GPDLER (*elem1*, *elem2*)

Purpose

Use **GPDLER** to delete all structure elements between and including the elements indicated by the specified element numbers.

After deletion, the element pointer moves to the element immediately preceding any deleted elements. If both values point beyond the last element of the structure or both values are less than zero, then the graPHIGS API does not delete any elements and the element pointer remains the same. If one of the values is less than zero, then the element pointer defaults to a value of zero. If one of the values is greater than the number of elements in the open structure, then the graPHIGS API uses the element number of the last element in the open structure.

Parameters

elem1 — **specified by user, fullword integer**
    First element number.

elem2 — **specified by user, fullword integer**
    Second element number.

Error Codes

4   FUNCTION REQUIRES STATE STOP

Related Subroutines

RCP code

201332737(X'0C001801')

GPEDMO - Set Edit Mode

GPEDMO (*mode*)

Purpose

Use **GPEDMO** to set the current edit mode entry of the graPHIGS API state list. If you do not use this subroutine, then the edit mode default to 1=INSERT_MODE.

When moving an element into an open structure, the edit mode determines how the element is placed into the structure:

1. When in 2=REPLACE_MODE, the graPHIGS API deletes the element at the element pointer and the incoming element takes its place. The element pointer does not move (so if you place another element into the structure, then it replaces the last element that was just placed into the structure). If the element pointer is set to element 0, then the graPHIGS API inserts the incoming element into the structure and sets the element element pointer to element 1.

2. When in 1=INSERT_MODE, the graPHIGS API inserts the incoming element into the open structure after the element at the element pointer. The element pointer is then incremented by 1 to point to the new element.

Parameters

mode — **specified by user, fullword integer**
    Edit mode (1=INSERT_MODE, 2=REPLACE_MODE).

Error Codes

121   EDIT MODE IS INVALID

Related Subroutines

None

RCP code

201331460 (X'0C001304')

GPEP - Set Element Pointer

GPEP (*elem*)

Purpose

Use **GPEP** to set the element pointer to the specified element number.

If the value is less than zero, then the graPHIGS API sets the pointer to zero. If the value is greater than the number of elements in the open structure, then the graPHIGS API sets the pointer to the last element.

Parameters

elem — **specified by user, fullword integer**
> Element pointer value.

Error Codes

4   FUNCTION REQUIRES STATE STOP

GPEPLG - Generalized Set Element Pointer at Label

GPEPLG (*label*, *flag*)

Purpose

Use **GPEPLG** to set the element pointer to the specified pick identifier element within the open structure.

Starting at the position following the current element pointer, the graPHIGS API searches for the first occurrence of the specified label. If the end of the structure is reached, then the result depends on the value of the label search flag (*flag*) parameter:

- If the value of the flag is `2=WRAP`, then the search continues starting at element 1 until the current element pointer is encountered. If the specified *label* is not found, the graPHIGS API issues an error and no action is performed.
- If the value of the flag is `1=NOWRAP`, then the graPHIGS API issues an error and no action is performed.

Parameters

label — **specified by user, fullword integer**
    Label identifier.

flag — **specified by user, fullword integer**
    Label search flag (`1=NOWRAP`, `2=WRAP`).

Error Codes

4   FUNCTION REQUIRES STATE STOP

GPEPPG - Generalized Set Element Pointer at Pick Identifier

GPEPPG (*pickid*, *flag*)

Purpose

Use **GPEPPG** to set the element pointer to the specified pick identifier element within the open structure.

Starting at the position following the current element pointer, the graPHIGS API searches for the first occurrence of the specified label. If the end of the structure is reached, then the result depends on the value of the pick identifier search flag (*flag*) parameter:

- If the value of the flag is `2=WRAP`, then the search continues starting at element 1 until the current element pointer is encountered. If the specified *pickid* is not found, then the graPHIGS API issues an error and no action is performed.
- If the value of the flag is `1=NOWRAP`, then the graPHIGS API issues an error and no action is performed.

Parameters

pickid **— specified by user, fullword integer**
    Pick identifier.

flag **— specified by user, fullword integer**
    Pick identifier search flag (`1=NOWRAP`, `2=WRAP`)

Error Codes

4   FUNCTION REQUIRES STATE STOP

136   VALUE OF SEARCH FLAG IS INVALID

    Set Pick Identifier

RCP code

201332231 (X'0C001607')

GPEST - Empty Structure

> **GPEST (*strid*)**

Purpose

Use **GPEST** to empty the contents of the specified structure.

References to this now empty structure remain intact. If the specified structure is the open structure, then the graPHIGS API sets the element pointer to zero. If the specified structure does not exist, then the graPHIGS API creates a new empty structure.

Parameters

strid **— specified by user, fullword integer**
    Identifier of the structure whose contents are emptied.

Error Codes

12   FUNCTION REQUIRES STATE SSSL

Related Subroutines

None

RCP code

201333249 (X'0C001A01')

GPMVER - Move Element Range

> **GPMVER (*elem1*, *elem2*)**

Purpose

Use **GPMVER** to move a range of elements from an open structure back into the same open structure but inserted following the current element pointer. The element pointer moves to the last element moved into the open structure.

- If the value for *elem1* is greater than the value for *elem2*, then the values are swapped. (The element range always starts at the lowest value and ends at the highest value.)
- If both values point beyond the last element of the specified structure or if both values are less than one, then the graPHIGS API does not perform the move.
- If one of the values is less than one, then the element number defaults to a value of one.
- If one of the values is greater than the number of elements in the specified structure, then the element number of the last element in that structure is used instead.
- If the element range includes the element pointed to by the current element pointer, then the graPHIGS API does not perform the move.

The value of the edit mode set by **GPEDMO** does not affect the functionality of this subroutine.

Parameters

elem1 — **specified by user, fullword integer**
Element number of the first element to move.

elem2 — **specified by user, fullword integer**
Element number of the last element to move.

Error Codes

4   FUNCTION REQUIRES STATE STOP

Related Subroutines

None

RCP code

201338627 (X'0C002F03')

GPNLER - Nullify Element Range

GPNLER (*re1*, *re2*)

Purpose

Use **GPNLER** to replace all elements between the specified structure elements in the open structure with Null Data structure elements. This subroutine requires that the structure state is Structure Open (STOP).

Two element search parameters, *re1* and *re2*, specify the range of structure elements to be processed. Each of these parameters is an array of three fullword integers. The first integer specifies the method to use in the element search and the second specifies the target value of the element search. The third integer specifies an option value.

If both of the specified elements point beyond the last element in the structure, then no elements are replaced and the element pointer remains unchanged.

If one of the specified elements points beyond the last element in the structure, then the graPHIGS API uses the last last element in the open structure instead.

If both of the element numbers are less than one, then the graPHIGS API does not replace any elements and the element pointer remains unchanged.

If one of the element numbers is less than one, then the element number value defaults to a value of one.

Elements between the lower element number and the higher element number are replaced with Null Data (**GPNULL**) structure elements. If the element range consists of only one element and the options on parameters *re1* and *re2* are conflicting, then the graPHIGS API applies to the 2=EXCLUDE option value.

After replacement of elements, the element pointer moves to the last element replaced.

Parameters

re1 — **specified by user, 3 fullword integers**
      1st range element search parameter in the following format:

```
        -----------------
    0 | search method   | fullword integer
        |---------------|
    4 | target value    | fullword integer
        |---------------|
    8 | option value    | fullword integer
        -----------------

      Search method supported:
          Method 1 = ELEMNUM
      Target value:
          For method 1, the target value is a structure element
          number.
      Option values supported:
          1 = INCLUDE
              Nullifies the resulting structure element derived
              from the range element search parameter.
          2 = EXCLUDE
              Does not nullify the resulting structure element
              derived from the range element search parameter.
```

re2 — **specified by user, 3 fullword integers**
      2nd range element search parameter. Format the same as *re1* above.

Error Codes

GPOEP - Offset Element Pointer

GPOEP (*offset*)

Purpose

Use **GPOEP** to move the element pointer to a new element relative to the current element pointer.

This subroutine adds the pointer offset value to the element pointer. The value can either be positive, which moves the element pointer forward, or negative, which moves the element pointer backward. If the resultant value is less than zero, then the element pointer defaults to a value of zero. If the resultant value is greater than the number of elements in the open structure, then the graPHIGS API sets the pointer to point to the last element.

Parameters

offset **— specified by user, fullword integer**
Element pointer offset value:

Positive offset value
Moves element pointer forward.

Negative offset value
Moves element pointer backward.

Error Codes

4   FUNCTION REQUIRES STATE STOP

Related Subroutines

GPQEP
Inquire Element Pointer

RCP code

201332226 (X'0C001602')

GPOPST - Open Structure

GPOPST (*strid*)

Purpose

Use **GPOPST** to open a structure. The structure state is set to Structure Open (STOP).

When the application opens a structure, the graPHIGS API sets the element pointer to the last element of the currently specified structure. If the specified structure does not exist in the currently selected structure store, then the graPHIGS API creates an empty structure and sets the element pointer to zero.

The currently selected structure store is locked to structure manipulation requests generated by other application processes, and the graPHIGS API considers the application process that opened the structure as the owning application process. The graPHIGS API postpones the requests from the other application processes until the open structure is closed (at which time the owning application process relinquishes its

lock on the structure store and the structure store becomes available for structure requests by other application processes). This ownership of the structure store ensures that other application processes cannot interfere with the structure requests of the owning application process until it closes the structure.

Parameters

strid — **specified by user, fullword integer**
    Structure identifier.

Error Codes

11   FUNCTION REQUIRES STATE STCL

Related Subroutines

GPCLST
    Close Structure

RCP code

201331457 (X'0C001301')

GPSSS - Select Structure Store

GPSSS (*ssid*)

Purpose

Use **GPSSS** to select a structure store. A structure store must be attached using the Create Structure Store (**GPCRSS**) subroutine or the Attach Resource (**GPATR**) subroutine before your application can call this structure element. The selected structure store becomes the target of all subsequent structure manipulation/editing subroutines until your application issues another call to **GPSSS**.

If a structure is currently open when a structure store is selected, then the graPHIGS API closes the structure. The specified structure store becomes the selected structure store and the structure state is set to Structure Closed (STCL).

Note: Creating a structure store or attaching a structure store does *not* automatically select the structure store for editing. If you did not suppress default connection processing during Open graPHIGS (**GPOPPH**), then this subroutine is automatically invoked as part of the **GPOPPH** processing. See **GPOPPH** for more information.

Parameters

ssid — **specified by user, fullword integer**
    Structure store identifier.

Error Codes

13   FUNCTION REQUIRES STATE SSOP

GPSSTH - Set Structure Store Threshold

GPSSTH (*ssid, threshold*)

Purpose

Use **GPSSTH** to specify a storage threshold for a structure store. This threshold represents the size (in bytes) of the structure store.

When the amount of storage allocated to the specific structure store exceeds the specified storage threshold, the graPHIGS API generates a Threshold Exceeded event and sends it to all application processes attached to the structure store. If the size of the structure store already exceeds the threshold value at the time the threshold value is set, then the graPHIGS API generates the event immediately. Once the event is generated, no further events are generated until your application calls **GPSSTH** again (by any application process attached to the structure store).

Each structure store has only one threshold value that your application can set. If your application sets a structure store threshold value, then that value overrides any other threshold that may have been set. For information on Threshold Events, see *The graPHIGS Programming Interface: Technical Reference*.

Parameters

ssid — **specified by user, fullword integer**
	Structure store identifier.

threshold — **specified by user, fullword integer**
	Structure store threshold value in bytes (>=0).

Error Codes

222	SPECIFIED STRUCTURE STORE DOES NOT EXIST

225	STRUCTURE STORE THRESHOLD SIZE < ZERO

RCP code

201331461 (X'0C001305')

GPTAST - Transfer All Structures

GPTAST (*ssid*, *flag*)

Purpose

Use **GPTAST** to copy all structures from a specified structure store to the currently selected structure store. Both the source and target structure stores can reside on the same or different nuclei. If the specified structure store is the currently selected structure store, then no action is taken.

If any structure within the specified structure store already exists in the currently selected structure store, then the graPHIGS API resolves the conflict according to the conflict resolution flag. If there is a conflict and the resolution flag is set to 1=MAINTAIN, then the graPHIGS API only transfers structures that do *not* conflict and there is no change to any existing structure. When the conflict resolution flag is set to 2=ABANDON, the graPHIGS API does not transfer any structures and issues an error. When the flag is set to 3=UPDATE, the graPHIGS API transfers every structure. The conflicting structure replaces the new one without changing any associations to a workstation or view.

> **Note:** The graPHIGS API empties the structure in the target structure store *before* it copies the source structure. If an error occurs (such as the copying of a structure cannot be completed), then the original structure cannot be reconstructed.

When you replace a structure that is an open structure, the structure remains open and is emptied, but the graPHIGS API does not remove references to the structure. The result is as though you had issued the following:

1. **GPCLST** - Close Structure
2. **GPEST** - Empty Structure
3. **GPTST** - Transfer Structures
4. **GPOPST** - Open Structure

If your application transfers an execute structure-type element that refers to a non-existing structure, then the graPHIGS API creates an empty structure.

Parameters

ssid — **specified by user, fullword integer**
    Structure store identifier.

flag — **specified by user, fullword integer**
    Conflict resolution flag (1=MAINTAIN, 2=ABANDON, 3=UPDATE).

Error Codes

GPTST - Transfer Structures

GPTST (*ssid*, *flag*, *number*, *lstrid*)

Purpose

Use **GPTST** to copy one or more structures from a specified structure store to the currently selected structure store. Both the source and target structure stores can reside on the same or different nuclei. If the specified structure store is the currently selected structure store, then no action is taken.

If any of the specified structures do not exist in the specified structure store and the specified structure identifier does not exist in the current structure store, then the graPHIGS API issues a warning and creates an empty structure. If any of the specified structures do not exist in the specified structure store and the specified structure identifier does exist in the current structure store and the conflict resolution flag is set to 3=UPDATE, then the graPHIGS API issues a warning and empties the structure.

If one of the specified structures already exists in the currently selected structure store, then the graPHIGS API resolves the conflict according to the conflict resolution flag. If there is a conflict and the resolution flag is set to 1=MAINTAIN, the graPHIGS API only transfers structures that do *not* conflict and there is no change to any existing structure. When the conflict resolution flag is set to 2=ABANDON, the graPHIGS API does not transfer any structures and issues an error. When the flag is set to 3=UPDATE, the graPHIGS API transfers every structure. The conflicting structure replaces the new one without changing any associations to a workstation or view.

> **Note:** The graPHIGS API empties the structure in the target structure store *before* it copies the source structure. If an error occurs (such as the copying of a structure cannot be completed), then the original structure cannot be reconstructed.

When you replace a structure that is an open structure, the structure remains open and is emptied, but the graPHIGS API does not remove references to the structure. The result is as though you had issued the following:

1. **GPCLST** - Close Structure
2. **GPEST** - Empty Structure
3. **GPTST** - Transfer Structures
4. **GPOPST** - Open Structure

If your application transfers an execute structure-type element that refers to a non-existing structure, then the graPHIGS API creates an empty structure.

Parameters

ssid — **specified by user, fullword integer**
> Structure store identifier.

flag — **specified by user, fullword integer**
> Conflict resolution flag (1=MAINTAIN, 2=ABANDON, 3=UPDATE).

number — **specified by user, fullword integer**
> Number of structure identifier entries in the list (>=1).

lstrid — **specified by user, array of fullword integers**
> A list of structure identifiers.

Error Codes

12   FUNCTION REQUIRES STATE SSSL

120   WARNING, ONE OR MORE STRUCTURES DO NOT EXIST

127   CONFLICT RESOLUTION FLAG IS INVALID

128   STRUCTURE CONFLICT OCCURS WHEN RESOLUTION FLAG IS ABANDON

134   NUMBER OF ENTRIES IN LIST < ONE

222   SPECIFIED STRUCTURE STORE DOES NOT EXIST

594   DATA EXCEEDS CONNECTION BUFFER SIZE

614   UNKNOWN ELEMENT FOUND IN STRUCTURE *n1*

GPTXCS - Set Text Character Set

```
GPTXCS (csid)
```

Purpose

Use **GPTXCS** to set the current text character set. This subroutine only sets a shell state and gets bound to a text primitive when the graPHIGS API creates it. The graPHIGS API uses this value to interpret character code points in subsequent text output primitives.

Parameters

csid — **specified by user, fullword integer**
> Character set identifier.

> See the Appendix A. "Character Set and Font Identifiers."

Error Codes

542   CHARACTER SET IDENTIFIER IS INVALID

Related Subroutines

None

RCP code

201328657 (X'0C000811')

Chapter 7. Archive Subroutines

The archive file subroutines allow your application to store structure data to a file on a disk when using the graPHIGS API. The same application or other applications can then retrieve this data at a later time. Since the graPHIGS API nucleus directly reads in archived structure data, performance can be improved (by reducing the overhead of data transmission from the shell to the nucleus). In addition, archive files save on the amount of memory needed by the application (storage that would have been used to hold the structure element data).

With the archive facility, your application can store structure data to, retrieve structure data from, or delete structure data from an archive file.

The Open Archive File (**GPOPAR**) subroutine gives you access to archive files. More than one archive file can be opened simultaneously. The Close Archive File (**GPCLAR**) subroutine terminates access to archive files.

With the appropriate data translations, any graPHIGS API system that supports archive files could use the archive file.

GPARAS - Archive All Structures

GPARAS (*arid*)

Purpose

Use **GPARAS** to store all structures from the currently selected structure store into the specified open archive file.

If any of the specified structures in the structure store already exists in the archive file, then the graPHIGS API resolves the conflict according to the value of the archive conflict resolution flag specified by the Set Conflict Resolution (**GPCNRS**) subroutine.

If an error occurs during the archival process, then the graPHIGS API issues a message and terminates the archival process. Any structures that were successfully transferred to the archive file are archived in their entirety.

> **Note:** The graPHIGS API empties the structure in the archive file before it copies the source structure. If an error occurs (such as the copying of a structure cannot be completed), then the original structure cannot be reconstructed.

Currently, the archive file resource and structure store *must* reside on the same nucleus. If the two resources are on different nuclei, then the graPHIGS API issues error 1109.

Parameters

arid — **specified by user, fullword integer**
    Archive file identifier.

GPARSN - Archive Structure Networks

GPARSN (*arid*, *number*, *lstrid*)

Purpose

Use **GPARSN** to store one or more structure networks from the currently selected structure store into the specified open archive file.

If any of the specified root structures do not exist in the currently selected structure store, then the graPHIGS API issues a warning and no action is taken for the non-existing root structures. If any of the specified structures in the structure networks already exists in the archive file, then the graPHIGS API resolves the conflict according to the value of the archive conflict resolution flag specified by the Set Conflict Resolution (**GPCNRS**) subroutine.

If an error occurs during the archival process, then the graPHIGS API issues a message and terminates the archival process. Any structures that were successfully transferred to the archive file are archived in their entirety.

> **Note:** The graPHIGS API empties the structure in the archive file before it copies the source structure. If an error occurs (such as the copying of a structure cannot be completed), then the original structure cannot be reconstructed.

Currently, the archive file resource and structure store *must* reside on the same nucleus. If the two resources are on different nuclei, then the graPHIGS API issues error 1109.

Parameters

arid — **specified by user, fullword integer**
Archive file identifier.

number — **specified by user, fullword integer**
Number of root structure identifier entries in the list (>=1).

lstrid — **specified by user, array of fullword integers**
List of root structure identifiers.

GPARST - Archive Structures

GPARST (*arid*, *number*, *lstrid*)

Purpose

Use **GPARST** to store one or more structures from the currently selected structure store into the specified open archive file.

If any of the specified structures do not exist in the currently selected structure store, then the graPHIGS API issues a warning and no action is taken for the non-existing structures. If one of the specified structures already exists in the archive file, then the graPHIGS API resolves the conflict according to the value of the archive conflict resolution flag specified by the Set Conflict Resolution (**GPCNRS**) subroutine.

If an error occurs during the archival process, then the graPHIGS API issues a message and terminates the archival process. Any structures that were successfully transferred to the archive file are archived in their entirety.

> **Note:** The graPHIGS API empties the structure in the archive file before it copies the source structure. If an error occurs (such as, the copying of a structure cannot be completed), then the graPHIGS API cannot reconstruct the original structure.

Currently, the archive file resource and structure store *must* reside on the same nucleus. If the two resources are on different nuclei, then the graPHIGS API issues error 1109.

Parameters

arid **— specified by user, fullword integer**
    Archive file identifier.

number **— specified by user, fullword integer**
> Number of structure identifier entries in the list (>=1).

lstrid **— specified by user, array of fullword integers**
> List of structure identifiers.

Error Codes

GPARSN	Archive Structure Networks
GPCNRS	Set Conflict Resolution

RCP code

201348612 (X'0C005604')

GPCNRS - Set Conflict Resolution

GPCNRS (*aflag*, *rflag*)

Purpose

Use **GPCNRS** to set the conflict resolution flags. The graPHIGS API uses these flags to determine how to resolve conflicts when you are archiving or retrieving one or more structures (e.g., when a structure that exists in a specified archive file has the same identifier as a structure that exists in the current structure store).

There are two conflict resolution flags: *aflag* for moving structure data to an archive file from a structure store and *rflag* for moving structure data from an archive file to a structure store. Your application can set either of these flags to: 1=MAINTAIN, 2=ABANDON, or 3=UPDATE.

- If the value is set to 1=MAINTAIN, then the graPHIGS API only transfers the structures that do not conflict.

- If the value is set to 2=ABANDON, then the graPHIGS API does not transfer any structures when a conflict occurs.

- If the value is set to 3=UPDATE, then the graPHIGS API transfers all the structures and replaces any conflicting structures with the new ones.

If this subroutine is not used, then the archival conflict resolution flag (*aflag*) defaults to a value of 3=UPDATE and the retrieval conflict resolution flag (*rflag*) defaults to a value of 2=ABANDON.

Parameters

aflag — **returned by the graPHIGS API, fullword integer**
Archive conflict resolution (1=MAINTAIN, 2=ABANDON, 3=UPDATE).

rflag — **returned by the graPHIGS API, fullword integer**
Retrieve conflict resolution (1=MAINTAIN, 2=ABANDON, 3=UPDATE).

Error Codes

127	CONFLICT RESOLUTION FLAG IS INVALID

GPDASA - Delete All Structures from Archive

GPDASA (*arid*)

Purpose

Use**GPDASA** to delete all structures from the specified open archive file.

This subroutine is equivalent to invoking the Delete Structures from Archive (**GPDSAR**) subroutine for each structure in the selected structure store.

When this subroutine call is completed, the state of the archive file is as if your application just created it.

Parameters

arid — **specified by user, fullword integer**
Archive file identifier.

Error Codes

7	FUNCTION REQUIRES STATE AROP
220	SPECIFIED ARCHIVE FILE DOES NOT EXIST
1113	FILE IS READ ONLY

Related Subroutines

GPDSAR - Delete Structures from Archive

GPDSAR (*arid*, *number*, *lstrid*)

Purpose

Use **GPDSAR** to delete one or more structures from the specified open archive file.

Note: The graPHIGS API does not check if other structures in the archive file reference the deleted structure. Therefore, the graPHIGS API does not delete the execute structure-type elements in other archived structures that reference the deleted structures.

Parameters

arid — **specified by user, fullword integer**
        Archive file identifier.

number — **specified by user, fullword integer**
        Number of structure identifier entries in the list (>=1).

lstrid — **specified by user, array of fullword integers**
        List of structure identifiers.

GPRVAS - Retrieve All Structures

GPRVAS (*arid*)

Purpose

Use **GPRVAS** to retrieve all structures from the specified open archive file and place them into the the currently selected structure store.

If any of the specified structures in the archive file already exists in the structure store, then the graPHIGS API resolves the conflict according to the value of the archive conflict resolution flag specified by the Set Conflict Resolution (**GPCNRS**) subroutine.

> **Note:** The graPHIGS API empties the structure in the target structure store before it copies the source structure. If an error occurs (such as the copying of a structure cannot be completed), then the original structure cannot be reconstructed.

When you retrieve a structure that is an open structure, the structure is closed, emptied, retrieved, and reopened and the graPHIGS API maintains all references to the structure. The result is as though you had issued the following:

1. **GPCLST** - Close Structure
2. **GPEST** - Empty Structure
3. **GPRVST** - Retrieve Structures
4. **GPOPST** - Open Structure

If the structure retrieved contains an execute structure-type element that references a non-existing structure, then the graPHIGS API creates an empty structure.

Currently, the archive file resource and the structure store *must* reside on the same nucleus. If the two resources are on different nuclei, then the graPHIGS API issues error 1109.

Parameters

arid — **specified by user, fullword integer**
> Archive file identifier.

Error Codes

7	FUNCTION REQUIRES STATE AROP

Chapter 8. Workstation Table Operations

When your application opens a workstation, the graPHIGS API creates workstation tables that describe that workstation. Each workstation table has default settings. Use the subroutines in this section to modify some of the table entries according to your application's specifications.

Most workstation table indexes begin with 1. The following exceptions begin with 0:
- color tables
- color processing tables
- depth cue tables
- view tables

Some table entries may not be modified.

The subroutines in this section do *not* create structure elements or modify structure content. The changed table values only take effect after you update the workstation. The application may inquire the default table settings by issuing the appropriate inquiry programming calls. For a listing of the default tables for each supported workstation type, see *The graPHIGS Programming Interface: Technical Reference*.

GPCML - Set Color Model

GPCML (*wsid*, *model*)

Purpose

Use **GPCML** to set the current color model for the specified workstation to the given color model.

This subroutine enables the application to specify the color model that the graPHIGS API uses to interpret the following colors when your application sets or inquires these colors by the corresponding API subroutines:
- colors in bundle tables
- light source color
- depth cue color
- view colors
- input echo colors

The color model set with **GPCML** does not apply to colors in primitive definitions or individual direct color attributes.

Parameters

wsid — **specified by user, fullword integer**
    Workstation identifier.

model — **specified by user, fullword integer**
    Color model (1=RGB, 2=HSV, 3=CMY, 4=CIELUV).

Error Codes

25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
318	COLOR MODEL INVALID

Related Subroutines

GPTXCD	Set Text Color Direct

RCP code

201329415 (X'0C000B07')

GPCPR - Set Color Processing Representation

GPCPR (*wsid*, *index*, *model*, *quant*, *data*)

Purpose

Use **GPCPR** to set the given color processing values into the specified entry of the workstation's color processing table.

The color processing table is 0 based, however, you cannot change entry 0 of the table. Entry 0 supports a color rendering model (*model*) of `1=RGB_NORMAL`, and a color quantization method (*quant*) of `1=WORKSTATION_DEPENDENT`. For information on color processing, see *The graPHIGS Programming Interface: Understanding Concepts (POWER-based System Only)*.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

index — **specified by user, fullword integer**
> Color processing mode table index (>=1).

model — **specified by user, fullword integer**
> Rendering color model (`1=RGB_NORMAL`, `2=RGB_B_ONLY`).

quant — **specified by user, fullword integer**
> Color quantization method (`1=WORKSTATION_DEPENDENT`, `2=BITWISE`).

data — **specified by user, 4 fullword integers**
> Color quantization parameters. The content of this parameter is dependent on the color quantization method.

> **If *quant*=1 (`WORKSTATION_DEPENDENT`)**
>> The *data* parameter is ignored.

> **If *quant*=2 (`BITWISE`)**
>> The *data* parameter requires the following format:

```
 0 |R bit length| fullword integer

 4 |G bit length| fullword integer

 8 |B bit length| fullword integer

12 |padding bits| fullword integer
```

>> **Note:** The least significant (right most) bits of the padding data are used.

Error Codes

25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
265	COLOR PROCESSING INDEX < ZERO
266	COLOR PROCESSING INDEX EXCEEDS THE WORKSTATION TABLE CAPACITY
267	SPECIFIED RENDERING COLOR MODEL IS NOT SUPPORTED
268	SPECIFIED QUANTIZATION METHOD IS NOT SUPPORTED

GPCRC - Create Color Table

GPCRC (*wsid*, *ctid*, *model*, *length*)

Purpose

Use **GPCRC** to create a color table with a specified color model and length for a specified workstation. All entries are initialized to the linear scale between the minimum and maximum values supported by the workstation.

This color table may be used for image processing. For information on using color tables for image processing, see *The graPHIGS Programming Interface: Understanding Concepts (POWER-based System Only)*.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

ctid — **specified by user, fullword integer**
Color table identifier (>=1).

model — **specified by user, fullword integer**
Color model (1=RGB).

length — **specified by user, fullword integer**
Length of color table in log2 (>0).

Error Codes

25	SPECIFIED WORKSTATION DOES NOT EXIST

35	WORKSTATION HAS ONLY INPUT CAPABILITIES
282	COLOR TABLE IDENTIFIER < ONE
283	COLOR TABLE IDENTIFIER ALREADY IS IN USE
285	SPECIFIED COLOR MODEL IS NOT SUPPORTED

GPDLC	Delete Color Table

RCP code

201329425 (X'0C000B11')

GPCSR - Set Cull Size Representation

GPCSR (*wsid*, *index*, *size*)

Purpose

Use **GPCSR** to store a cull size threshold into the specified entry in the workstation's cull size table. Each entry of the cull size table is initially set to a cull size of 0.01. For a complete discussion of conditional structure execution, see *The graPHIGS Programming Interface: Understanding Concepts (POWER-based System Only)*.

Parameters

wsid **— specified by user, fullword integer**
    Workstation identifier.

index **— specified by user, fullword integer**
    Cull size table index. (>=1).

size **— specified by user, short floating-point number (DC)**
    Cull size (>=0).

Error Codes

25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
278	CULL SIZE INDEX < ONE
279	CULL SIZE INDEX EXCEEDS THE WORKSTATION TABLE CAPACITY
280	CULL SIZE < ZERO

GPDCR - Set Depth Cue Representation

GPDCR (*wsid*, *index*, *id*, *value*)

Purpose

Use **GPDCR** to set one group of the specified entry in the workstation's depth cue table.

The values in the entry are applied during traversal when the current depth cue index is set to the specified entry. Each entry of the depth cue table is initially set to a depth cue mode of `1=SUPPRESSED`.

The depth cue table is 0 based, however, entry 0 of the table cannot be changed. It always contains a depth cue mode of `1=SUPPRESSED`.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

index — **specified by user, fullword integer**
> Depth cue table index(>=1).

id — **specified by user, fullword integer**
> Group identifier(`1=DEPTH_CUE_MODE, 2=DEPTH_CUE_REFERENCE_PLANE, 3=DEPTH_CUE_SCALE_FACTOR, 4=DEPTH_CUE_COLOR`).

value — **specified by user, array of fullword quantities**
> Value(s) to be set in the group of the specified group *id*The values for each group identifier (*id*)have a unique data format, listed as follows:

> **Group Identifier 1 -Depth cue mode**
> > A fullword integer(`1=SUPPRESSED, 2=ALLOWED`)/

> **Group Identifier 2 -Depth cue reference planes (NPC)**
> > Two short floating-point numbers specifying the far and near depth cue reference plane distance (0.0<=far<near<=1.0)

> **Group Identifier 3 -Depth cue scale factors**
> > Two short floating-point numbers specifying two scale factors corresponding to the far and near reference planes(0.0<=*factor*<=1.0).

> **Group Identifier 4 -Depth cue color**
> > Four fullwords of data with either of the following formats:

```
        indexed format                    direct format
        -------------                     -------------
     0 |           1| fullword integer   0 |          2| fullword integer
       |-----------|                       |-----------|
     4 |color index| fullword integer   4 |component 1| short floating-point number
       |-----------|                       |-----------|
     8 |    ignored| fullword integer   8 |component 2| short floating-point number
       |-----------|                       |-----------|
    12 |    ignored| fullword integer  12 |component 3| short floating-point number
       -------------                       -------------
```

GPDLC - Delete Color Table

GPDLC (*wsid*, *ctid*)

Purpose

Use **GPDLC** to delete the specified color table from the specified workstation. If the color table is used to define any images, they are automatically canceled.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

ctid — **specified by user, fullword integer**
Color table identifier (>=1).

Error Codes

GPDMR - Set Data Mapping Representation

GPDMR (*wsid, index, method, mdata, clengths, ctype, cdata*)

Purpose

Use **GPDMR** to set the specified data mapping values into the specified entry of the data mapping table.

The data mapping representation provides the values that the graPHIGS API uses to perform data mapping on area primitives. The entry used is selected by the data mapping index specified by Set Data Mapping Index (**GPDMI**) or Set Back Data Mapping Index (**GPBDMI**).

During traversal, if the data mapping method is inconsistent with the contents of the primitive, then the graPHIGS API renders the primitive using data mapping method `1=DM_METHOD_COLOR`.

If the *method* parameter has the value `1=DM_METHOD_COLOR`, then you do not need to supply any additional data mapping data: the graPHIGS API ignores the values in the parameters following the *method* parameter.

The data mapping table is zero-based; however, entry zero cannot be changed. Entry zero always contains a data mapping method of `1=DM_METHOD_COLOR`. Use **GPQWDT** to inquire the data mapping facilities of a specific workstation.

See *The graPHIGS Programming Interface: Understanding Concepts* for more detailed information.

Parameters

wsid — **specified by user, fullword integer**
    Workstation identifier.

index — **specified by user, fullword integer**
    Data mapping index (>=1).

method — **specified by user, fullword integer**
    Data mapping method (`-1=IMAGE_ARRAY`, `1=DM_METHOD_COLOR`, `2=SINGLE_VALUE_UNIFORM`, `4=BI_VALUE_UNIFORM`).

mdata — **specified by user, variable data**
    Data mapping method descriptor. This parameter must have one of the following formats, depending on the specified data mapping method:

```
-1=IMAGE_ARRAY                                 The following data is specified:

                                                        ---------------------
                                            WORDS 1  |     'udindex'     |  Fullword integer
                                                        ---------------------
                                                  2  |     'vdindex'     |  Fullword integer
                                                        ---------------------
                                                  3  |     'ulolim'      |  Floatingpoint number
                                                        ---------------------
                                                  4  |     'uhilim'      |  Floatingpoint number
                                                        ---------------------
                                                  5  |     'vlolim'      |  Floatingpoint number
                                                        ---------------------
                                                  6  |     'vhilim'      |  Floatingpoint number
                                                        ---------------------
```

udindex   Index into the primitive's data list for the *u* data value
                             (>=1)

vdindex   Index into the primitive's data list for the *v* data value
                             (>=1)

ulolim   Lower limit of the *u* data mapping range/
uhilim   Upper limit of the *u* data mapping range/
vlolim   Lower limit of the *v* data mapping range/
vhilim   Upper limit of the *v* data mapping range/

1=DM_METHOD_COLOR
          N/A (No data mapping descriptor is returned for
          this method.)

2=SINGLE_VALUE_UNIFORM
          The following data is required:

```
                                                        ---------------------
                                            WORDS 1  |     'dindex'      |  Fullword integer
                                                        ---------------------
                                                  2  |     'lolim'       |  Floatingpoint number
                                                        ---------------------
                                                  3  |     'hilim'       |  Floatingpoint number
                                                        ---------------------
```

dindex   Index into the primitive's data list (>=1)
lolim   Lower limit of the data mapping range
hilim   Upper limit of the data mapping range

4=BI_VALUE_UNIFORM
          The data mapping record required is identical to
          -1=IMAGE_ARRAY.

clengths — **specified by user, variable data**
          Data mapping color data lengths. The format of this parameter is dependent on the *method*
          parameter:

-1=IMAGE_ARRAY   The following data is required:

```
                                                        ---------------------
                                            WORDS 1  |     'x_size'      |  Fullword integer
                                                        ---------------------
                                                  2  |     'y_size'      |  Fullword integer
                                                        ---------------------
                                                  3  |     'oformat'     |  Fullword integer
                                                        ---------------------
```

x_size   *x* dimension of the base color data array (>=1)
y_size   *y* dimension of the base color data array (>=1)

oformat	Data organization format (1=BASE_DATA, 2=SQUARE_MM, 3=RECT_MM). This format determines the filtering methods which may be used.

If data organization format selected is 2=SQUARE_MM or 3=RECT_MM, then *x_size* and *y_size* must be powers of 2.

1=DM_METHOD_COLOR
    No data is required.

2=SINGLE_VALUE_UNIFORM
    The following data is required:

```
                            --------------------
            WORD  1         |       'n_ent'     |  Fullword Integer
                            --------------------
```
n_ent	The number of entries in the color data list (>=1).

4=BI_VALUE_UNIFORM
    The following data is required:

```
                            --------------------
            WORDS 1         |       'n_lists'   |  Fullword integer
                            --------------------
                 2n         |       'n_ent'     |   n_lists *
                            Z                   Z  Fullword integer
                            |                   |
                            --------------------
```
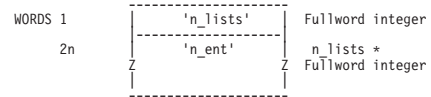

n_lists	The number of lists of data values (>=1).
n_ent	A list of fullword integers that specify the number of entries of each color data list (>=1). There are *n_lists* entries in this list.

ctype — **returned by the graPHIGS API, fullword integer**
    Data mapping color data type. Supported types are:

1=TYPE_COLOR
    Colors consist of three short floating-point numbers in the current workstation color model (0<=color_component<=1). During traversal, the current transparency coefficient is used with these color values. See **GPTCO** for more information.

2=TYPE_PACKED_RGB
    Colors consist of four bytes. The first three bytes represent the red, green, and blue color components respectively; the fourth byte is ignored. During traversal, the current transparency coefficient is used with these color values. See **GPTCO** for more information.

3=TYPE_COLOR_TRANS
    Colors consist of four short floating-point numbers. The first three numbers represent the color in the current workstation color model (0.0<=color_component<=1.0); the fourth number represents the transparency coefficient (0.0<=transparency_coefficient<=1.0). During traversal, these values override the current transparency coefficient. See **GPTCO** for more information.

4=TYPE_PACKED_RGB_ALPHA
    Colors consist of four bytes. The first three bytes represent the red, green, and blue color components respectively; the fourth byte is an unsigned integer alpha ([default]) blending value that may be derived from a transparency coefficient as follows:

```
Alpha = X'FF' [default] (1.0-transparency_coefficient)
```

(Alpha = X'00') is fully transparent and equivalent to (transparency_coefficient=1.0). (Alpha = X'FF') is fully opaque and equivalent to (transparency_coefficient=0.0). During traversal, these values override the current transparency coefficient. See **GPTCO** for more information.

cdata — **specified by user, variable data**

Data mapping color data. The data mapping color data organization is defined by the *clengths* and *ctype* parameters.

The `2=SINGLE_VALUE_UNIFORM` and `4=BI_VALUE_UNIFORM` color lists are supplied from the *lolim* lower limits to the *hilim* upper limits. For example, the color representing the data value *lolim* is first in each list, and the color representing *hilim* is last. See Figure 3 and Figure 4. The number of color values in each `2=SINGLE_VALUE_UNIFORM` color list is given by *n_ent*.

Figure 3. SINGLE_VALUE_UNIFORM Color Data Organization

```
              n_ent
       ------------------
       | ------------> |
       ------------------
    --+----------------+-->
      |                |
    lolim            hilim
```
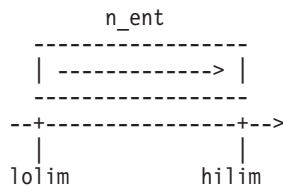

`U Data Value`

The number of color values in each of the `4=BI_VALUE_UNIFORM` color lists is specified by *n_ent[i]*, so that the total number of color values in this color array is:

```
 (n_ent[1] + n_ent[2] + n_ent[3] + ... + n_ent[n_lists])
```

Figure 4. BI-VALUE_UNIFORM Color Data Organization
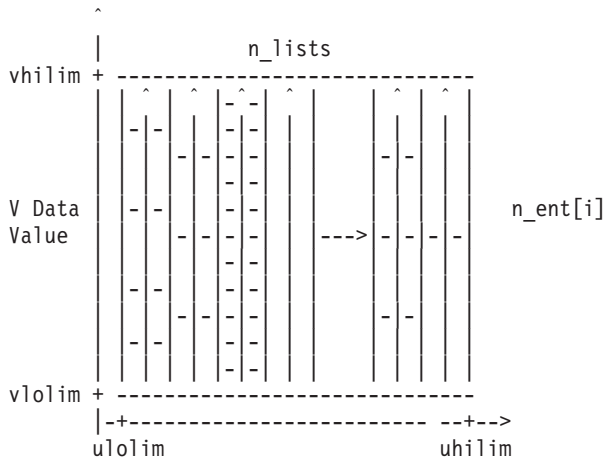

```
        ^

        ulolim                     uhilim
```

`  U Data Value`

The `IMAGE_ARRAY` color arrays are organized according to the *oformat* field of the *clengths* parameter. `BASE_DATA` array color data is supplied in row order left-to-right and bottom-to-top. See Figure 5 The number of color values in this array is:

*(x_size * y_size)*

Figure 5. IMAGE_ARRAY BASE_DATA Color Data Organization
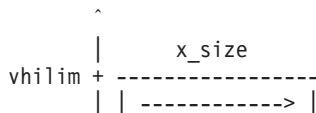

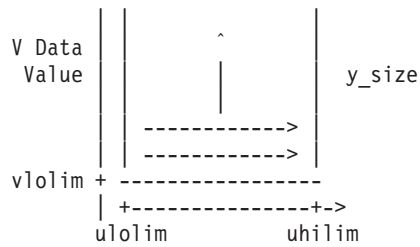

```
            ^
            |        x_size
    vhilim + ------------------
            | | ------------> |

       | +--------------+->
            ulolim             uhilim
```

U Data Value

SQUARE_MM color mipmap data is supplied in the same fashion, starting with the base image and continuing with each successively smaller mipmap image, until either *x_size* or *y_size* is equal to one. See Figure 6. The number of color values in this complete array is:

*(x_size * y_size) + (x_size * y_size)/4 + (x_size * y_size)/16 + ...*

which reduces to the integer portion of:

*((4 * x_size * y_size) - (MAX(x_size,y_size) / MIN(x_size,y_size))) / 3*

Figure 6. IMAGE_ARRAY SQUARE_DATA Color Data Organization
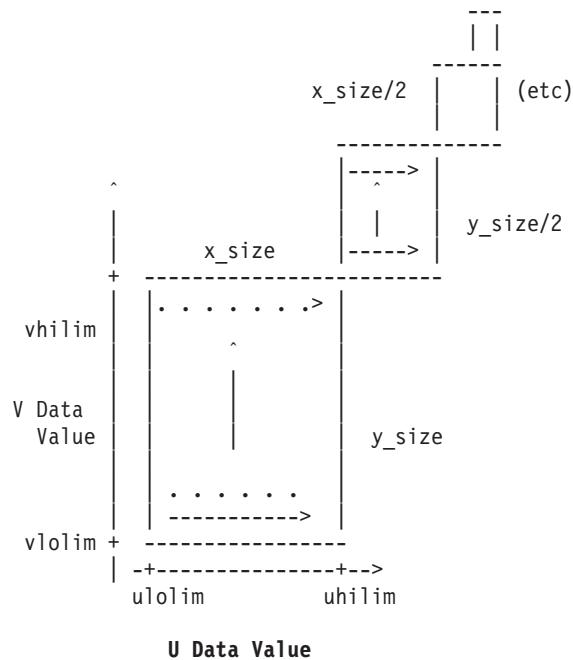

```
                                        ---
                                        | |
                                      ------
                           x_size/2   |   |   (etc)
                                      |   |
                                    --------------
                                    |----->  |
                 ^                  | ^       |
                 |                  | |       | y_size/2
                 |        x_size    |----->   |

GPGTXC - Set Geometric Text Culling

GPGTXC (*wsid*, *height*, *method*)

Purpose

Use **GPGTXC** to set the geometric text culling height for the specified workstation.

When displaying geometric text, if the transformed height of the characters in Device Coordinates (DC) is less than the specified culling height, then the graPHIGS API replaces the text with an alternate representation if one was selected.

This subroutine is assigned escape identifier 1008.

> **Note:** This subroutine is an escape subroutine, and therefore, may not be available on all workstations. Use the Inquire List of Available Escape Subroutines (**GPQES**) subroutine to determine if this subroutine is supported by a specific workstation.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

height — **specified by user, floating-point number (DC)**
Geometric text culling height (>=0.0).

method — **specified by user, fullword integer**
Display method for displaying geometric text when the height of the characters is less than the specified culling height.

1=TEXT_DISPLAY
each stroke of each character is displayed (the default method).

2=BOX_DISPLAY
a polyline is drawn around the text extent rectangle using the text color.

3=NO_DISPLAY
the character text is not displayed.

GPHLF - Set Highlighting Filter

```
GPHLF (wsid, inclen, incl, exclen, excl)
```

Purpose

Use GPHLF to set the inclusion and exclusion highlighting filters for the specified workstation. The new filters take effect when the workstation is updated.

The filters consist of class names which indicate which classes are to be included or excluded from highlighting. The same class names may exist in both the inclusion and exclusion filter. If a class name is in both filters when the workstation is updated, the class will be excluded. For more information on classes and class names see *The graPHIGS Programming Interface: Understanding Concepts*.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

inclen — **specified by user, fullword integer**
Inclusion filter list length (>=0).

incl — **specified by user, array of fullword integers**
List of class names to be included in the highlighting filter (0<=class name<=workstation maximum).

exclen — **specified by user, fullword integer**
Exclusion filter list length (>=0).

excl — **specified by user, array of fullword integers**
List of class names to be excluded from the highlighting filter (0<=class name<=workstation maximum).

GPHR - Set Hatch Representation

GPHR (*wsid*, *hatch*, *format*, *length*, *data*)

Purpose

Use **GPHR** to change a hatch pattern associated with a specific hatch index.

Some workstations require that the hatch fill be at a fixed size. The fixed sizes are a power of two. Therefore, specifying a hatch pattern with sizes that are a power of two produces the best results (i.e., no seams or discontinuity in the fill operation). See the Set Interior Style Index (**GPISI**) subroutine for the default hatch patterns in the workstation's hatch table.

Parameters

wsid **— specified by user, fullword integer**
> Workstation identifier.

hatch **— specified by user, fullword integer**
> Hatch table index (>=1).

format **— specified by user, fullword integer**
> Format (1=BIT_ARRAY).

length **— specified by user, fullword integer**
> Length of hatch pattern definition data in bytes.

data **— specified by user, variable data**
> Hatch pattern definition data.

> **1=BIT ARRAY**

```
          -----------------
     0 |        x-size | fullword integer (number of columns)
       |---------------|
     4 |        y-size | fullword integer (number of rows)
       |---------------|
     8 |       pattern | bit array (array of unsigned characters)
       |               |
          -----------------
```

> **Note:** The bit array must be in row order with each row beginning on a byte boundary. Therefore, the size of the bit array is ((x hyphen size plus 7) slash 8 % % asterisk y hyphen size) bytes.

GPIVF - Set Invisibility Filter

GPIVF (*wsid*, *inclen*, *incl*, *exclen*, *excl*)

Purpose

Use **GPIVF** to set the inclusion and exclusion invisibility filters for the specified workstation.

The new filters take effect when the application updates the workstation. The filters consist of class names which indicate which classes the graPHIGS API includes or excludes from invisibility. The same classes may exist in both the inclusion and exclusion filter. If a class is in both filters when the application updates the workstation, then the graPHIGS API excludes the class. For more information on classes and class names, see *The graPHIGS Programming Interface: Understanding Concepts*.

Parameters

wsid **— specified by user, fullword integer**
>   Workstation identifier.

inclen **— specified by user, fullword integer**
>   Inclusion filter list length (>=0).

incl **— specified by user, array of fullword integers**
>   List of class names to be included in the invisibility filter (0<=class name<=workstation maximum).

exclen **— specified by user, fullword integer**
>   Exclusion filter list length (>=0).

excl **— specified by user, array of fullword integers**
>   List of class names to be excluded from the invisibility filter (0<=class name<=workstation maximum).

GPLNR - Set Linetype Rendering

GPLNR (*wsid*, *ltype*, *style*, *data*)

Purpose

Use **GPLNR** to set the line rendering attributes for the specified line type table entry. The specified attributes are applied as part of rendering a line primitive. These attributes control the appearance of line primitives when rendered on the display.

The line rendering styles are:

- `1=WORKSTATION_DEPENDENT_RENDERING`

	Use the line type representation entry to render the line. The final appearance of the line is workstation-dependent and depends on the capabilities of the workstation.

- `2=SCALED_TO_FIT_RENDERING`

	Use the line type representation entry to render the line as follows:

	1. If the length of the line is less than the specified minimum threshold, then the graPHIGS API renders the line as a solid line.

	2. The line type pattern in the specified entry of the workstation's line type table is scaled such that the graPHIGS API renders the line using a whole number of repetitions of the scaled pattern. (The pattern may be scaled larger or smaller to fit.)

The line rendering style for line table entry 1 cannot be changed. It always defines the solid line pattern.

Parameters

wsid — **specified by user, fullword integer**
	Workstation identifier.

ltype — **specified by user, fullword integer**
	Line type. This parameter specifies the line type table entry to which the rendering attributes are applied (>=2).

style — **specified by user, fullword integer**
	Rendering style identifier (`1=WORKSTATION_DEPENDENT_RENDERING`, `2=SCALED_TO_FIT_RENDERING`).

data — **specified by user, array of data**
	Rendering style definition data. Depending on the *style* parameter values you specified, rendering definition data is as follows:

	If *style*=1 (`WORKSTATION_DEPENDENT_RENDERING`)
		N/A (No data is required for workstation dependent rendering)

	If *style*=2 (`SCALED_TO_FIT_RENDERING`)
		The following data is required:
		- Minimum threshold size (DC)

A short floating-point number that specifies the minimum threshold size for scaling the line pattern (>=0)

- Line pattern unit size (DC)

  A short floating-point number that specifies the length of the line pattern unit of the specified entry of the line type representation table (>0)

GPLSR - Set Light Source Representation

GPLSR (*wsid*, *index*, *type*, *color*, *data*)

Purpose

Use **GPLSR** to store the specified light source information into the specified entry of the workstation's light source table.

Each entry of the light source table is initially set to a light source type of `1=AMBIENT` and light source direct color values of 1.0, 1.0, and 1.0.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

index — **specified by user, fullword integer**
Light source table index (>=1).

type — **specified by user, fullword integer**
Light source type (`1=AMBIENT, 2=DIRECTIONAL, 3=POSITIONAL, 4=SPOT`).

color — **specified by user, four fullwords of data**
Light source color. This parameter must have one of the following two formats:

```
     indexed format                         direct format
     -------------                          -------------
 0 |            1| fullword integer     0 |            2| fullword integer
   |-----------|                          |-----------|
 4 |color index| fullword integer       4 |component 1| short floating-point number
   |-----------|                          |-----------|
 8 |    ignored| fullword integer       8 |component 2| short floating-point number
   |-----------|                          |-----------|
12 |    ignored| fullword integer      12 |component 3| short floating-point number
     -------------                          -------------
```

data — **specified by user, array of short floating-point numbers**
Light source type dependent data. Required data for each light source type is listed below. They must be specified in the order shown in the list:

1=AMBIENT
none

2=DIRECTIONAL
Light source direction - 3 short floating-point numbers (WC)

3=POSITIONAL
Light source position - 3 short floating-point numbers (WC)

Attenuation coefficients - 2 short floating-point numbers. The first floating-point number must be >0. The second floating-point number must be >=0.

4=SPOT Light source position - 3 short floating-point numbers (WC)

Light source direction - 3 short floating-point numbers (WC)

Concentration exponent - short floating-point number (>=0)

Attenuation coefficients - 2 short floating-point numbers. The first floating-point number must be >0. The second floating-point number must be >=0.

Spread angle - short floating-point number. The spread angle must be in radians (0.0<=angle<=[default])

GPLTR - Set Linetype Representation

GPLTR (*wsid*, *ltype*, *number*, *list*)

Purpose

Use **GPLTR** to set a one-dimensional pattern that defines a specific line type in the workstation's line type table.

The Set Linetype (**GPLT**) subroutine and the Set Edgetype (**GPELT**) subroutine specify a line type entry. This entry selects a line pattern that the graPHIGS API applies to subsequent lines, curves, and edges.

The pattern is defined by an array of integers which specify the length of each solid and void section. Each integer defines a multiple of the minimum size pattern section that your workstation can generate. The sections alternate between solid and void with the first section always being solid.

Line type table entry 1 cannot be changed. It always defines the solid line pattern.

Parameters

wsid **— specified by user, fullword integer**
>Workstation identifier.

ltype **— specified by user, fullword integer**
>Line type (>=2).

number **— specified by user, fullword integer**
>Number of pattern sections. This parameter specifies the number of sections in the line pattern contained in *list* (even number>=2).

list **— specified by user, array of fullword unsigned integers**
>Line pattern sections. Each entry of this array defines a section of the line pattern. The entries of the array alternate between solid and void sections with the first entry being solid. The value of each entry defines the length of the section in multiples of the minimum section size supported by the workstation. The sum of the line pattern sections must be >=1.

GPMTR - Set Marker Type Representation

GPMTR (*wsid*, *mtype*, *format*, *length*, *data*)

Purpose

Use **GPMTR** to set a two-dimensional pattern representation that defines a marker in the workstation's marker type table. The Set Marker Type (**GPMT**) subroutine specifies a marker type entry. This entry selects a marker pattern your application applies to subsequent markers.

Marker type table entry 3 cannot be changed. It always defines the asterisk marker.

Parameters

wsid — **specified by user, fullword integer**
       Workstation identifier.

mtype — **specified by user, fullword integer**
       Marker type table index (>=1, <>3).

format — **specified by user, fullword integer**
       Format (`1=VECTOR`).

length — **specified by user, fullword integer**
       Length of entire marker pattern definition data (even integer >=8) in bytes.

data — **specified by user, variable data**
       Marker pattern definition data. This parameter must have the following format:

       Format 1=graPHIGS VECTOR FONT
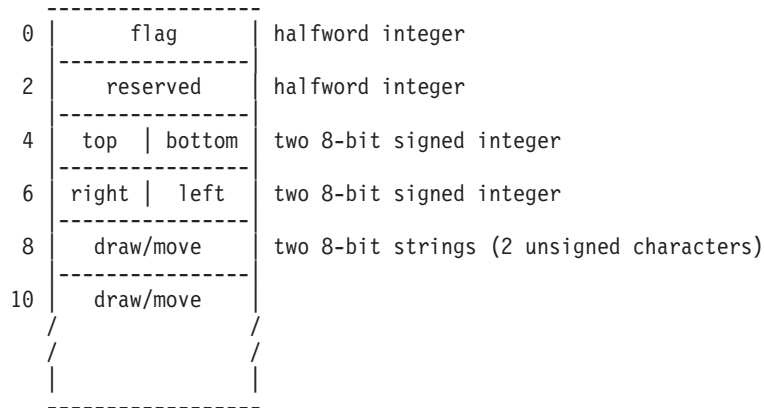

```
          -----------------
       0 |      flag       |  halfword integer
         |----------------|
       2 |    reserved     |  halfword integer
         |----------------|
       4 |  top  | bottom  |  two 8-bit signed integer
         |----------------|
       6 | right |  left   |  two 8-bit signed integer
         |----------------|
       8 |    draw/move     |  two 8-bit strings (2 unsigned characters)
         |----------------|
      10 |    draw/move     |
         /                /
         /                /
         |                |
          -----------------
```

Each field specifies:

flag

```
       0      1                        15
       ------------------------------------
      | fill |          reserved          |
      | flag |                            |
       ------------------------------------
```

If the fill flag=1, and the workstation supports filled characters, then the marker will
be filled.

reserved

Must be 0.

top, bottom, right, left

Four 8-bit signed integers specifying the marker rectangle measured from the origin. The
marker definition must be within this rectangle (top > bottom, right > left)

```
        -------------  ^
       |     |     | | | top
       |-----------| |
       |     |     | | | bottom
        ------------- v
       <----   ---->
        left   right
```
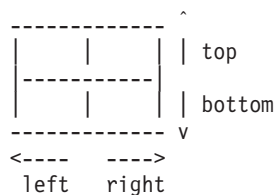

draw/move

A pair of 8-bit unsigned characters specifying a relative draw/move starting from the origin
(the marker position) with the format *sxxxxxx*1 and *syyyyyyb*, where *s* is sign bit and *b* is
blank bit. When the blank bit=1, then the *sxxxxxx* and *syyyyyy* strings specify a relative
move; otherwise, they specify a relative draw. A workstation which supports scalable
markers uses this maker definition format. The graPHIGS API maps the specified marker
box height (top-bottom) to the nominal marker size of the workstation. The total data size
cannot exceed the maximum marker pattern size supported by the workstation.

GPPAR - Set Pattern Representation

GPPAR (*wsid*, *index*, *numrow*, *numcol*, *strrow*, *strcol*, *nrow*, *ncol*, *array*)

Purpose

Use **GPPAR** to set a given pattern definition in the specified entry in the workstation's pattern table.

The pattern is a grid of color indexes of dimension *nrow* x *ncol* within the array of dimension *numrow* x *numcol* starting at the position defined by *strrow*, *strcol*.

Some workstations required that the pattern fill is a fixed size. For these workstations, the graPHIGS API replicates the specified pattern to the fixed size.

Parameters

wsid **— specified by user, fullword integer**
Workstation identifier.

index **— specified by user, fullword integer**
Pattern index (>=1) Index of pattern table entry to be loaded.

numrow **— specified by user, fullword integer**
Number of rows in the input array (>=1).

numcol **— specified by user, fullword integer**
Number of columns in the input array (>=1).

strrow **— specified by user, fullword integer**
Row within array that is the start of the pattern (>=1).

strcol **— specified by user, fullword integer**
Column within array that is the start of the pattern (>=1).

nrow — **specified by user, fullword integer**
>   Number of rows within array to be used for pattern beginning at the starting position (>=1).

ncol — **specified by user, fullword integer**
>   Number of columns within array to be used for pattern beginning at the starting position (>=1).

array — **specified by user, array of fullword integers**
>   A grid of *numrow* x *numcol* color indexes. The array must be in row order. The pattern within this array begins at position *strrow,strcol*, and is of dimension *nrow* x *ncol*.

GPVIP - Set View Input Priority

GPVIP (*wsid*, *view*, *refview*, *flag*)

Purpose

Use **GPVIP** to modify the input priority of the given view in relation to another view on the specified workstation.

When the application updates the workstation, the current view input priority for the specified view is set to the requested values.

This subroutine only changes the input priority of a view. There are no visual changes on the display surface.

>   **Note:** The Set View Priority (**GPVP**) subroutine is treated as a simultaneous invocation of the Set View Input Priority (**GPVIP**) and the Set View Output Priority (**GPVOP**) and subroutines.

Parameters

wsid — **specified by user, fullword integer**
>   Workstation identifier.

view — **specified by user, fullword integer**
>   View index (>=0).

refview — **specified by user, fullword integer**
>   Reference view index (>=0).

flag — **specified by user, fullword integer**
>   Relative priority of the specified view with respect to the reference view (`1=HIGHER, 2=LOWER`).

Error Codes

GPVOP - Set View Output Priority

GPVOP (*wsid*, *view*, *refview*, *flag*)

Purpose

Use **GPVOP** to modify the output priority of the given view in relation to another view on the specified workstation.

The application draws the contents of the lower priority view before the contents of a higher priority view. The highest priority view defaults to a view of zero. This subroutine only changes the output priority of a view. This can produce visual changes on the display.

When the application updates the workstation, the graPHIGS API sets the current view output priority for the specified view to the requested values.

>   **Note:** The Set View Priority (**GPVP**) subroutine is treated as a simultaneous invocation of the Set View Input Priority (**GPVIP**) and the Set View Output Priority (**GPVOP**) subroutines.

Parameters

wsid — **specified by user, fullword integer**
>   Workstation identifier.

view — **specified by user, fullword integer**
> View index (>=0).

refview — **specified by user, fullword integer**
> Reference view index (>=0).

GPVP - Set View Priority

GPVP (*wsid*, *view*, *refview*, *flag*)

Purpose

Use **GPVP** to modify both the relative input and output priority of the given view in relation to another view on the specified workstation.

This subroutine sets the requested priority reference number and the requested relative priority to the specified values. When the application updates the workstation, the graPHIGS API sets the current priority reference number and current relative priority to the requested values.

This subroutine changes the output as well as the input priority of the specified view. This can produce visual changes on the display.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

view — **specified by user, fullword integer**
> View index (>=0).

refview **— specified by user, fullword integer**
> Priority reference view index (>=0).

GPXCR - Set Extended Color Representation

> GPXCR (*wsid*, *ctid*, *start*, *number*, *color*)

Purpose

Use **GPXCR** to set the specified color values starting at the specified workstation's color table entry. The color values are interpreted according to the workstation's color model.

Only modifiable color tables may be changed. Use the Inquire Extended Color Representation (**GPQXCR**) subroutine to determine the characteristics of the workstation's color table.

Parameters

wsid **— specified by user, fullword integer**
> Workstation identifier.

ctid **— specified by user, fullword integer**
> Color table identifier of a modifiable color table existing on the workstation
> (`-1=DISPLAY_COLOR_TABLE,` `0=RENDERING_COLOR_TABLE,` `> 0=IMAGE COLOR TABLES`).

start **— specified by user, fullword integer**
> Start color index (>=0).

number **— specified by user, fullword integer**
> Number of entries to be set (>=1).

color **— specified by user, array of short floating-point numbers**
> The color table values to be set in the specified color table (0.0<=component<=1.0).

> The array is assumed to be in row order such as RED1, GREEN1, BLUE1, RED2, GREEN2, BLUE2, etc....

GPXER - Set Extended Edge Representation

GPXER (*wsid*, *index*, *id*, *value*)

Purpose

Use **GPXER** to set one field of the specified entry in the workstation's edge bundle table. These attribute values are applied during traversal when the appropriate ASF is set to `1=BUNDLED` and the current edge index is set to the specified entry. These attribute values can also be set individually.

Parameters

wsid **— specified by user, fullword integer**
> Workstation identifier.

index — **specified by user, fullword integer**
>   Edge bundle table index (>=1).

id — **specified by user, fullword integer**
>   Edge group identifier (1=OFF, 2=ON, 3=GEOMETRY_ONLY).

value — **specified by user, variable data**
>   The value that may be set for each field is expressed in the data format listed below:

>   **Group Identifier 1 - Edge flag**
>   >   A fullword integer (1=OFF, 2=ON, 3=GEOMETRY_ONLY).

>   **Group Identifier 2 - Edge line type**
>   >   A fullword integer. Specifies an index into the workstation's edge line type table. The table size and specified entries supported are workstation dependent. Use the Inquire Edge Facilities (**GPQEF**) subroutine to determine the supported edge line types on your workstation. The default edge line type table for supported entries is defined with the following line types: (1=SOLID_LINE, 2=DASHED, 3=DOTTED, 4=DASH_DOT, 5=LONG_DASH, 6=DOUBLE_DOT, 7=DASH_DOUBLE_DOT, 8-n=SOLID_LINE) (>=1 Any entry may be changed by GPLTR except entry 1).

>   **Group Identifier 3 - Edge linewidth scale factor**
>   >   A short floating-point number.

>   **Group Identifier 4 - Edge color**
>   >   Four fullwords of data with either of the following two formats:

```
        indexed format                       direct format
      -------------                        -------------
   0 |           1| fullword integer    0 |           2| fullword integer

GPXIR - Set Extended Interior Representation

GPXIR (*wsid*, *index*, *id*, *value*)

Purpose

Use **GPXIR** to set one field of the specified entry in the workstation's interior bundle table. These attribute values are applied during traversal when the appropriate ASF is set to 1=BUNDLED and the current interior index is set to the specified entry. These attribute values can also be set individually.

The 1=HOLLOW and 5=EMPTY interior styles display nothing for the interior. If the edge flag is set to 1=OFF and the interior style is 5=EMPTY, then the graPHIGS API generates no visual output. The interior is detectable when the graPHIGS API encounters a primitive with with an interior style of 5=EMPTY and the primitive is eligible for picking as determined by its visibility and detectability.

If the edge flag is 1=OFF and the interior style is 1=HOLLOW, then the graPHIGS API draws the boundary (solid line) When the graPHIGS API encounters a primitive with an interior style 1=HOLLOW only the boundary of the primitive is eligible for picking as determined by its visibility and detectability.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

index — **specified by user, fullword integer**
> Interior bundle table index (>=1).

id — **specified by user, fullword integer**
> Interior group identifier (1=INTERIOR_STYLE, 2=INTERIOR_STYLE_INDEX, 3=INTERIOR_COLOR).

value — **specified by user, variable data**
> The value that may be set for each field is expressed in the data format listed below:

> **Group Identifier 1 - Interior style**
>> A fullword integer (1=HOLLOW, 2=SOLID, 3=PATTERN, 4=HATCH, 5=EMPTY).

> **Group Identifier 2 - Interior style index**
>> A fullword integer (>=1) which is an index into the pattern or hatch table depending on the current interior style.

> **Group Identifier 3 - Interior color**
>> Four fullwords of data with either of the following two formats:

```
    indexed format                          direct format
    -------------                           -------------
 0 |           1| fullword integer       0 |           2| fullword integer

GPXPLR - Set Extended Polyline Representation

GPXPLR (*wsid*, *index*, *id*, *value*)

Purpose

Use **GPXPLR** to set one field in the specified entry of the workstation's polyline bundle table.

These attribute values are applied during traversal when the appropriate ASF is set to `1=BUNDLED` and the current polyline index is set to the specified entry. These attribute values can also be set individually.

Parameters

wsid — **specified by user, fullword integer**
>Workstation identifier.

index — **specified by user, fullword integer**
>Polyline bundle table index (>=1).

id — **specified by user, fullword integer**
>Polyline group identifier (`1=LINETYPE`, `2=LINEWIDTH_SCALE_FACTOR`, `3=POLYLINE_COLOR`).

value — **specified by user, variable data**
>The value that may be set for each field is expressed in the data format listed below:

>**Group Identifier 1 - Line type**
>>A fullword integer (>=1). Specifies an index into the workstation's line type table. The table size and specific entries supported is workstation dependent. Use the Inquire Polyline Facilities (**GPQPLF**) subroutine to determine the supported line types on your workstation. The default line type table for supported entries is defined with the following line types: (`1=SOLID_LINE`, `2=DASHED`, `3=DOTTED`, `4=DASH_DOT`, `5=LONG_DASH`, `6=DOUBLE_DOT`, `7=DASH_DOUBLE_DOT`, `8-n=SOLID_LINE`). Any entry may be changed by GPLTR except entry 1).

GPXPMR - Set Extended Polymarker Representation

GPXPMR (*wsid*, *index*, *id*, *value*)

Purpose

Use **GPXPMR** to set one field of the specified entry in the workstation's polymarker bundle table.

These attribute values are applied during traversal when the appropriate ASF is set to `1=BUNDLED` and the current polymarker index is set to the specified entry. These attribute values can also be set individually.

Parameters

wsid — **specified by user, fullword integer**
   Workstation identifier.

index — **specified by user, fullword integer**
   Polymarker bundle table index (>=1).

id — **specified by user, fullword integer**
   Polymarker group identifier (`1=MARKER_TYPE, 2=MARKER_SIZE_SCALE_FACTOR, 3=POLYMARKER_COLOR`).

value — **specified by user, variable data**
   The value that may be set for each field is expressed in the data format listed below:

   Group Identifier 1 - Marker type table index
      A fullword integer (>=1). Specifies an index into the marker type table of the workstation. The table size and specific entries supported are workstation dependent. Use the Inquire Polymarker Facilities (**GPQPMF**) subroutine to determine the supported marker types on your workstation. The default marker type table for supported entries is defined with the following marker types: (`1=DOT, 2=PLUS_SIGN, 3=ASTERISK, 4=CIRCLE, 5=DIAGONAL_CROSS, 6-n=ASTERISK`. Any entry may be changed by **GPMTR** except entry 3).

   Group Identifier 2 - Marker size scale factor
      A short floating-point number.

   Group Identifier 3 - Polymarker color
      Four fullwords of data with either of the following two formats:

```
    indexed format                       direct format
    -------------                        -------------
 0 |           1| fullword integer   0 |           2| fullword integer
   |-----------|                        |-----------|
 4 |color index| fullword integer   4 |component 1| short floating-point number
   |-----------|                        |-----------|
 8 |    ignored| fullword integer   8 |component 2| short floating-point number
   |-----------|                        |-----------|
12 |    ignored| fullword integer  12 |component 3| short floating-point number
    -------------                        -------------

GPXTXR - Set Extended Text Representation

GPXTXR (*wsid*, *index*, *id*, *value*)

Purpose

Use **GPXTXR** to set one field of the specified entry in the workstation's text bundle table.

These attribute values are applied during traversal when the appropriate ASF is set to `1=BUNDLED` and the current text index is set to the specified entry. These attribute values can also be set individually.

Parameters

wsid **— specified by user, fullword integer**
> Workstation identifier.

index **— specified by user, fullword integer**
> Text index (>=1).

id **— specified by user, fullword integer**
> Text group identifier (`1=TEXT_FONT, 2=TEXT_PRECISION, 3=CHARACTER_EXPANSION_FACTOR, 4=CHARACTER_SPACING, 5=TEXT_COLOR`).

value **— specified by user, variable data**
> Value to be set in the field of the specified group identifier expressed in the data format listed below:

> **Group Identifier 1 - Text font**
> > A fullword integer (1-255).

> **Group Identifier 2 - Text precision**
> > A fullword integer (`1=STRING_PREC, 2=CHAR_PREC, 3=STROKE_PREC`).

> **Group Identifier 3 - Character expansion factor**
> > A short floating-point value (>=0).

> **Group Identifier 4 - Character spacing**
> > A short floating-point value.

Group Identifier 5 - Text color

Four fullwords of data with either of the following two formats:

```
       indexed format                     direct format
       -------------                      -------------
   0 |             1| fullword integer  0 |            2| fullword integer
     |-----------|                        |-----------|
   4 |color index| fullword integer  4 |component 1| short floating-point number

GPXVCH - Set Extended View Characteristics

GPXVCH (*wsid*, *view*, *number*, *charids*, *values*)

Purpose

Use **GPXVCH** to set one or more characteristics of the specified view. Characteristics which may be set with this subroutine include: clipping indicators, appearance of the viewport, a value indicating if the view is displayed, and a value indicating if the display view option changes frequently.

The values specified are stored in the requested view table entries. When the application updates the workstation, the graPHIGS API sets the corresponding current values to the requested values.

The clipping indicators determine to which boundaries the contents of the view are clipped. The shielding indicator determines if the content of lower priority views may be displayed within the boundaries of the specified viewport. The border indicator specifies if a border is to be drawn around the viewport. The view active flag determines if the view and its contents are displayed.

When set to 2=ON, the temporary view indicator indicates that the corresponding view will have its view activity changed frequently. Where possible the device support saves the current underlying screen image. This allows deactivation to consist of restoring the underlying screen image without requiring structure traversal. A typical use of the temporary view capability is the "pop-up menu" found in many applications today.

Application developers should be aware of the following points:
- The temporary view indicator acts as an indicator to the graPHIGS API that the corresponding view is active only for a short period of time. If used properly, it can greatly contribute to the interactive performance of viewport deactivation.
- The best efficiency is gained when a temporary view is the highest priority active viewport.

The workstation's view table is 0 based, however, view entry 0 cannot be changed. (For the default values for the view entry 0, see *The graPHIGS Programming Interface: Technical Reference*).

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

view — **specified by user, fullword integer**
View index (>=1). Index of view table entry to be altered.

number — **specified by user, fullword integer**
Number of characteristic identifiers in the *charids* list (>=1).

charids — **specified by user, array of fullword integers**
List of characteristic identifiers. Each integer identifies a view characteristic to be set.

values — **specified by user, array of fullword integers**
List of characteristic values. Each list entry specifies the value to be applied to the corresponding characteristic identifier listed in the *charids* list.

Valid view characteristic identifiers and values are:

- 1 = View window clipping indicator (1=NOCLIP, 2=CLIP)
- 2 = Near clipping indicator (1=NOCLIP, 2=CLIP)
- 3 = Far clipping indicator (1=NOCLIP, 2=CLIP)
- 4 = View shielding indicator (1=OFF, 2=ON)
- 6 = View border indicator (1=OFF, 2=ON)
- 8 = View active flag (1=INACTIVE, 2=ACTIVE)
- 9 = Temporary view indicator (1=OFF, 2=ON)

RCP code

201330434 (X'0C000F02')

GPXVR - Set Extended View Representation

GPXVR (*wsid*, *view*, *id*, *value*)

Purpose

Use **GPXVR** to set one field in the entry of the specified workstation's view table.

The values specified are stored in the requested view table entry. When the application updates the workstation, the graPHIGS API sets the corresponding current values in the view table entry to the requested values. You can set only one field at a time with each subroutine call. Issue multiple invocations of **GPXVR** to set multiple fields.

The clipping indicators determine to which boundaries the contents of the view are clipped. The shielding indicator determines if the content of lower priority views may be displayed within the boundaries of the specified viewport. The border indicator specifies if a border is to be drawn around the viewport.

When set to 2=ON, the temporary view indicator indicates that the corresponding view will have its view activity changed frequently. Where possible the device support saves the current underlying screen image. This allows deactivation consist of restoring the underlying screen image without requiring structure traversal. A typical use of the temporary view capability is the ″pop-up menu″ found in many applications today.

Application developers should be aware of the following points:
- The temporary view indicator acts as an indicator to the graPHIGS API that the corresponding view is active only for a short period of time. If used properly, it can greatly contribute to the interactive performance of viewport deactivation.
- The best efficiency is gained when a temporary view is the highest priority active viewport.

When setting a view's projection type to perspective, any image mappings currently defined to the view are canceled.

The view active flag for output determines if the view and its contents are displayed. The view active flag for input considers the view for transformation of locator and stroke input from Device Coordinate (DC) to World Coordinates (WC).

The antialiasing mode defines the algorithm that the graPHIGS API uses when rendering primitives within the specified view. It improves the quality of the image and reduces the jagged appearance of the objects. The highest quality image results when you set the antialiasing mode to 2=SUBPIXEL_ON_THE_FLY. However, for better performance, set the antialiasing mode to 3=NON_SUBPIXEL_ON_THE_FLY Issuing the Set Antialiasing Mode (**GPAID**) structure element specifies whether the antialiasing algorithm is to be applied to the primitives within the view.

The shield alpha value defines the initial alpha value for the view shield. The value is used to initialize the destination alpha values when alpha planes are present and shielding indicator is on. The initial shield alpha value does not affect the initial shield color, but is used to blend subsequent primitives with the view shield when blending is in effect.

Other viewing parameters can also be controlled, such as Hidden Line/Hidden Surface Removal (HLHSR) mode, transparency processing, initial color processing, and initial frame buffer mask. Color processing mode and frame buffer protect mask are traversal defaults and are applied to images as well as to structure content.

The workstation's view table is 0 based, however, view entry 0 cannot be changed. (See *The graPHIGS Programming Interface: Technical Reference* for the default values for view entry 0).

> **Note:** The following functions are treated as other forms of this generic subroutine:
> - GPVCH - Set View Characteristics
> - GPXVCH - Set Extended View Characteristics
> - GPVMT2 - Set View Matrix 2
> - GPVMT3 - Set View Matrix 3
> - GPVMP2 - Set View Mapping 2
> - GPVMP3 - Set View Mapping 3

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

view — **specified by user, fullword integer**
View table index (>=1).

id — **specified by user, fullword integer**
Group identifier (1<= *id*<=24). See group identifier values defined below.

value — **specified by user, array of fullword quantities**
The value to be set for each group is expressed in the following data formats:

Group Identifier 1 - Window clipping indicator
A fullword integer (1=NOCLIP, 2=CLIP).

Group Identifier 2 - Near clipping indicator
A fullword integer (1=NOCLIP, 2=CLIP).

Group Identifier 3 - Far clipping indicator
A fullword integer (1=NOCLIP, 2=CLIP).

Group Identifier 4 - Shielding indicator
A fullword integer (1=OFF, 2=ON).

Group Identifier 5 - Shielding color
Four fullwords of data with either of the following two formats:

```
    indexed format                      direct format
   -------------                       -------------
 0 |          1| fullword integer   0 |          2| fullword integer
   |-----------|                       |-----------|
 4 |color index| fullword integer   4 |component 1| short floating-point number
   |-----------|                       |-----------|
 8 |    ignored| fullword integer   8 |component 2| short floating-point number
   |-----------|                       |-----------|
12 |    ignored| fullword integer  12 |component 3| short floating-point  number
   -------------                       -------------
```

Group Identifier 6 - Border indicator
A fullword integer (1=OFF, 2=ON).

Group Identifier 7 - Border color
Four fullwords of data with either of the following two formats:

```
    indexed format                      direct format
   -------------                       -------------
 0 |          1| fullword integer   0 |          2| fullword integer
   |-----------|                       |-----------|
 4 |color index| fullword integer   4 |component 1| short floating-point  number
   |-----------|                       |-----------|
 8 |    ignored| fullword integer   8 |component 2| short floating-point number
   |-----------|                       |-----------|
12 |    ignored| fullword integer  12 |component 3| short floating-point number
   -------------                       -------------
```

Group Identifier 8 - Reserved
This field is reserved.

Group Identifier 9 - Temporary view indicator
A fullword integer (1=OFF, 2=ON).

Group Identifier 10 - HLHSR mode
A fullword integer (1=OFF, 2=ON_THE_FLY).

Group Identifier 11 - Transparency processing mode
A fullword integer (1=OFF, 2=PARTIAL_TRANSPARENT, 3=BLEND, 4=BLEND_ALL).

Group Identifier 12 - Initial color processing mode index

A fullword integer (>=0).

> **Note:** This color processing index is not applied to shielding or border color.

Group Identifier 13 - Initial frame buffer write protect mask

A 32-bit bit string.

> **Note:** The frame buffer mask is *not* applied to shielding or border color.

Group Identifier 14 - Viewport, 2D form

4 short floating-point numbers (including only Xmin, Xmax, Ymin, Ymax). For the set subroutine call, Zmin and Zmax are set to their default values.

Group Identifier 15 - Viewport, 3D form

6 short floating-point numbers (Xmin, Xmax, Ymin, Ymax, Zmin, Zmax).

Group Identifier 16 - View volume, 2D form

4 short floating-point numbers specifying the view window (Umin, Umax, Vmin, Vmax). For the set subroutine call, other fields of the view volume group are set to their default values.

Group Identifier 17 - View volume, 3D form

10 short floating-point numbers and a fullword integer specifying a view window (Umin,Umax,Vmin,Vmax), near plane distance, far plane distance, projection reference point (*u*, *v*, *n*), view plane distance and a projection type (1=PARALLEL, 2=PERSPECTIVE).

```
----------------------
|        Umin        |  short floating-point number
|--------------------|
|        Umax        |  short floating-point number
|--------------------|
|        Vmin        |  short floating-point number
|--------------------|
|        Vmax        |  short floating-point number
|--------------------|
| near plane distance|  short floating-point number
|--------------------|
| far plane distance |  short floating-point number (=>near plane)
|--------------------|
|    U projection-   |  short floating-point number
|   reference point  |
|--------------------|
|    V projection-   |  short floating-point number
|   reference point  |
|--------------------|
|    N projection-   |  short floating-point number
|   reference point  |
|--------------------|
| view plane distance|  short floating-point number
|--------------------|
|   projection type  |  fullword integer
----------------------
```

Group Identifier 18 - View matrix, 2D form

9 short floating-point numbers. For the input view matrix, the elements are in the following order:

```
|m11  m12  m13|
|m21  m22  m23|-->(m11,m12,m13,m21.....m33)
|m31  m32  m33|
```

The 3[default]3 matrix is expanded by the graPHIGS API into a 4[default]4 matrix as follows:

```
|a  b  c|         |a b 0 c|
|d  e  f| ----->  |d e 0 f|
|g  h  i|         |0 0 1 0|
                  |g h 0 i|
```

When inquired, the matrix returned is the expanded 4[default]4 matrix. For the set subroutine call, other elements are set to their default values.

Group Identifier 19 - View matrix, 3D form

16 short floating-point numbers. For the input view matrix, the elements must be in the following order:

```
|m11 m12 m13 m14|
|m21 m22 m23 m24| ---> (m11,m12,m13,m14,m21,m22,.....m44)
|m31 m32 m33 m34|
|m41 m42 m43 m44|
```

Group Identifier 20 - View input active flag

A fullword integer specifying the view that is to be made active/inactive for input (1=INACTIVE, 2=ACTIVE)

Group Identifier 21 - View output active flag

A fullword integer specifying the view that is to be made active/inactive for output (1=INACTIVE, 2=ACTIVE).

Group Identifier 22 - View mapping matrix, 2D form

9 short floating-point numbers including:

```
|m11  m12  m13|
|m21  m22  m23| --->(m11,m12,m13,m21.....m33)
|m31  m32  m33|
```

Group Identifier 23 - View mapping matrix, 3D form

16 short floating-point numbers including:

```
|m11 m12 m13 m14|
|m21 m22 m23 m24| --->(m11,m12,m13,m14,m21,m22,.....m44)
|m31 m32 m33 m34|
|m41 m42 m43 m44|
```

Group Identifier 24 - Antialiasing mode

A fullword integer (1=OFF, 2=SUBPIXEL_ON_THE_FLY, 3=NON_SUBPIXEL_ON_THE_FLY).

Group Identifier 25 - Shield alpha value

A fullword integer ($0<=alpha<=255$). The default value of the shield alpha value is 255 (opaque).

Chapter 9. Display Subroutines

The data stored in a structure store or image board resource cannot be displayed until an affiliation is created that ties the data together with a view in a workstation. The subroutines in this chapter are used to create and delete these ties.

For structure store resources, this bond is created and deleted by associating and disassociating structure networks to a view. To associate a structure network to a view, the owning structure store resource must first be associated to the workstation (either by using the Associate Structure Store with Workstation [**GPASSW**] [page GPASSW - Associate Structure Store with Workstation] subroutine or by automatic structure store association by the Open Workstation [**GPOPWS**] [page GPOPWS - Open Workstation] subroutine).

For image board resources, the association is formed and dispelled by creating and deleting image mappings. This view association can only occur if the Define Image (**GPDFI**) subroutine has been used to define an image on a workstation.

In addition to the subroutines that perform the above ties, this chapter also defines those subroutines that associate and disassociate structure networks to a workstation (useful only to preload data into those workstations that require a special data format) and those subroutines that empty one or more views of a workstation.

GPARV - Associate Root with View

> GPARV (*wsid*, *view*, *strid*, *prior*)

Purpose

Use **GPARV** to add a structure network to the traversal list for the specified view at the location defined by the priority parameter.

This subroutine implicitly performs an Associate Root with Workstation (**GPARW**) subroutine.

This subroutine is necessary because the association of a structure network to a view is required in order to actually display the data in the structures in the network.

The specified structure is searched for in the structure store associated with the workstation. If there is no structure store associated with the workstation, an error is generated. If the specified structure does not exist in the associated structure store, an empty structure is created. If the specified structure is already associated with the workstation, its location in the traversal list is modified according to the specified priority.

Parameters

wsid — **specified by user, fullword integer**
     Workstation identifier.

view — **specified by user, fullword integer**
     View index (>=0).

strid — **specified by user, fullword integer**
     Structure identifier.

prior — **specified by user, short floating-point number**
     Priority (0.0<= *prior*<=1.0).

Error Codes

25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
59	VIEW INDEX VALUE < ZERO
126	PRIORITY VALUE IS INVALID
224	SPECIFIED VIEW DOES NOT HAVE ASSOCIATED STRUCTURE STORE
323	VIEW INDEX EXCEEDS VIEW TABLE CAPACITY

GPARW - Associate Root with Workstation

GPARW (*wsid*, *strid*)

Purpose

Use **GPARW** to convert a structure network within the currently selected structure store into the workstation specific format.

This subroutine has its meaning and effect only for the workstation that requires structures in a workstation specific format. For a workstation which can directly traverse the common format, this subroutine is ignored and has no effect.

If the selected structure is not associated with any view of the specified workstation, no action is performed. If the specified structure does not exist, an empty structure is created.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

strid — **specified by user, fullword integer**
Structure identifier.

Error Codes

12	FUNCTION REQUIRES STATE SSSL
25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES

GPCIM2 - Create Image Mapping 2

GPCIM2 (*wsid*, *imap*, *view*, *index*, *origin*, *size*, *P*, *Q*, *R*, *method*, *prior*)

Purpose

Use **GPCIM2** to define the mapping of an image to a specified view of a workstation.

A rectangle on the specified image is mapped into a parallelogram on the World Coordinates' (WC) *x*, *y* plane and is associated with the specified view. The parallelogram is identified by the specified image mapping identifier. If the specified image mapping identifier is already in use, the existing image mapping is deleted and a new image mapping is created. This subroutine only supports views in parallel projection. If the specified view has its projection type set to perspective, the image mapping is *not* defined and an error message is issued. If the projection type of a view is set to perspective and image mappings are currently defined to that view, the image mappings for the view are deleted before the projection type is set to perspective.

The priority parameter defines the relationship of this image mapping to others within the same view. Higher priority images will be displayed last.

Parameters

wsid — **specified by user, fullword integer**
        Workstation identifier.

imap — **specified by user, fullword integer**
        Image mapping identifier.

view — **specified by user, fullword integer**
        View index (>=0).

index — **specified by user, fullword integer**
        Defined image index (>=1).

origin — **specified by user, two fullword integers**
        Origin of the image rectangle (*x*, *y*).

size — **specified by user, two fullword integers**
        Size of the image rectangle (*sx*, *sy*).

P — **specified by user, 2 short floating-point numbers (WC)**
        Lower left corner of the mapped rectangle in WC.

Q — **specified by user, 2 short floating-point numbers (WC)**
        Lower right corner of the mapped rectangle in WC.

R — **specified by user, 2 short floating-point numbers (WC)**
        Top left corner of the mapped rectangle in WC.

method — **specified by user, fullword integer**
        Image mapping method (`1=PIXEL_BY_PIXEL`).

prior — **specified by user, short floating-point number**
    Priority (0.0<= *prior*<=1.0).

Error Codes

25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
59	VIEW INDEX VALUE < ZERO
126	PRIORITY VALUE IS INVALID
236	RECTANGLE DEFINITION IS INVALID
288	IMAGE INDEX NOT WITHIN WORKSTATION TABLE RANGE

GPCIM3 - Create Image Mapping 3

GPCIM3 (*wsid*, *imap*, *view*, *index*, *origin*, *size*, *P*, *Q*, *R*, *method*, *prior*)

Purpose

Use **GPCIM3** to define the image mapping of an image to a specified view of a workstation.

A rectangle on the specified image is mapped into a parallelogram in World Coordinates (WC) and is associated with the specified view. The parallelogram is identified by the specified image mapping identifier. If the specified image mapping identifier is already in use, the existing image mapping is deleted and a new image mapping is created.

This subroutine only supports views in parallel projection. If the specified view has its projection type set to perspective, the image mapping is *not* defined and an error message is issued. If the projection type of a view is set to perspective and image mappings are currently defined to that view, the image mappings for the view are deleted before the projection type is set to perspective.

The priority parameter defines the relationship of this image mapping to others within the same view. Higher priority images will be displayed last.

Parameters

wsid — specified by user, fullword integer	Workstation identifier.
imap — specified by user, fullword integer	Image mapping identifier.
view — specified by user, fullword integer	View index (>=0).
index — specified by user, fullword integer	Defined image index (>=1).
origin — specified by user, two fullword integers	Origin of the image rectangle (*x*, *y*).
size — specified by user, two fullword integers	Size of the image rectangle (*sx*, *sy*).
P — specified by user, 3 short floating-point numbers (WC)	Lower left corner of the mapped rectangle in WC.
Q — specified by user, 3 short floating-point numbers (WC)	Lower right corner of the mapped rectangle in WC.
R — specified by user, 3 short floating-point numbers (WC)	Top left corner of the mapped rectangle in WC.
method — specified by user, fullword integer	Image mapping method (`1=PIXEL_BY_PIXEL`).
prior — specified by user, short floating-point number	Priority (0.0<= *prior*<=1.0).

Chapter 10. Transformation Subroutines

The transformation subroutines found in this section fall into three general categories: modeling clipping, modeling transformations and workstation transformations.

Modeling Clipping

The four modeling clipping subroutines are:

GPMCI	Set Modeling Clipping Indicator
GPMCV2	Set Modeling Clipping Volume 2
GPMCV3	Set Modeling Clipping Volume 3
GPRMCV	Restore Modeling Clipping Volume

The modeling clipping subroutines create modeling clipping structure elements, which modify the current modeling clipping values that the graPHIGS API applies to primitives during traversal.

Modeling Transformations

The four modeling transformation subroutines are:

GPGLX2	Set Global Transformation 2
GPGLX3	Set Global Transformation 3
GPMLX2	Set Modeling Transformation 2
GPMLX3	Set Modeling Transformation 3

The modeling transformation subroutines create transformation structure elements, which modify the current transformation values that the graPHIGS API applies to primitives during traversal.

Workstation Transformations

The three workstation transformation subroutines are:

GPDCMM	Set Device Coordinate Mapping Method
GPWSX2	Set Workstation Transformation 2
GPWSX3	Set Workstation Transformation 3

The workstation transformation subroutines **GPWSX2** and **GPWSX3** allow the application to modify the mapping of Normalized Projection Coordinates (NPC) into Device Coordinates (DC) for a specified workstation. **GPDCMM** controls how an image is displayed on a specified workstation.

> **Note:** When the graPHIGS API inserts a structure element into an open structure following the element pointer, the pointer moves to the new element.

GPBDMF - Set Back Data Morphing Factors

GPBDMF (*flength, fdata*)

Purpose

Use **GPBDMF** to insert a Set Back Data Morphing Factors structure element into the open structure following the element pointer, or to replace the element pointed at by the element pointer with a Set Back Data Morphing Factors structure element, depending on the current edit mode.

During traversal, the graPHIGS API combines the values of *fdata* with a primitive's data morphing vectors to modify its rendered data mapping data. If the face distinguish mode (**GPFDMO**) is 1=NONE, then the graPHIGS API uses the current data morphing scale factors when performing data mapping on the back facing portions of area primitives. If the face distinguish mode is 2=COLOR_SURFACE_PROPERTIES, then the graPHIGS API uses these values when performing data mapping on only back facing portions of area primitives.

In data morphing, the graPHIGS API combines the data mapping data values (x_1, x_2, ..., x_{ndata}) with the back data morphing scale factors in the *fdata* parameter (s_1, $s_{\#EMPTY>2}$, ..., s_{nscale}) and the data morphing vectors (($d_{1,1}$, $d_{1,2}$, ..., $d_{1,ndata}$), ($d_{\#EMPTY>2,1}$, $d_{2,2}$, ..., $d_{\#EMPTY>2,ndata}$), ..., ($d_{nvector,1}$, $d_{nvector,2}$, ..., $d_{\#EMPTY>nvector,ndata}$)) to obtain the new back data mapping data values (x'_1, x'_2, ..., x'_{ndata}). This combination is of the form:

$$x'_1 = s_1\ x_1 + s_2\ d_{1,1} + s_3\ d_{2,1} + ... + s_{nscale}\ d_{nvector,1}$$

$$x'_2 = s_1\ x_2 + s_2\ d_{1,2} + s_3\ d_{2,2} + ... + s_{nscale}\ {nvector,2}$$

...

$$x'_{ndata} = s_1\ x_{ndata} + s_2\ d_{1,\ ndata} + s_3\ d_2, ndata> + ... + s_{nscale}\ d_{nvector,ndata}$$

These equations show that the number of morphing scale factors should be one more than the number of morphing vectors in the affected primitive (*nscale*=*nvector*+1). However, if the number of morphing vectors and scale factors disagree at traversal time, then 0 value vectors and scale factors are assumed wherever necessary. For example, if you supply too many scale factors for a given primitive (*nscale*>*nvector*+1), then the graPHIGS API ignores the extra scale factors, as if there were additional 0 valued morphing vectors in the primitive definition. If you supply too few scale factors (*nscale*<*nvector*+1), then the graPHIGS API ignores the extra morphing vectors, just as if there were additional scale factors with value zero in this function call.

The traversal default for data morphing is *flength*=1 and *fdata*={1.0}.

Use **GPQWDT** to inquire the morphing facilities of a specified workstation.

Parameters

flength— **specified by user, fullword integer (>=1)**
    Number of morphing factors.

fdata — **specified by user, array of short floating-point numbers**
    List of morphing factors. The number of entries in this list is given by the *flength* parameter.

Error Codes

5	FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)
61	LENGTH IS INVALID

RCP code

201343521 (X'0C004221')

GPDCMM - Set Device Coordinate Mapping Method

GPDCMM(*wsid*, *method*, *length*, *data*)

Purpose

Use**GPDCMM** to control how an image is displayed on a specified workstation. Only workstations which use the facilities of a window system (e.g., X-Windows) have use for this procedure. This subroutine specifies the method for transforming the graPHIGS API coordinate values to window coordinate values of a window system.

The graPHIGS API uses the *method* parameter to determine how the graPHIGS API performs the coordinate transformation. The valid methods include:

1=MAPPED

The graPHIGS API device coordinate range is scaled to fit the size of the window. The graPHIGS API preserves the aspect ratio of the workstation's device coordinate range. If the application makes the window smaller (or larger), then the size of the data of the window decreases (or increases) in direct proportion but the amount of data in the window remains the same. This is the default method.

2=DIRECT

The graPHIGS API displays the graPHIGS API device coordinate range directly into the window without scaling the contents. The graPHIGS API uses the lower, left corner of the window as the origin of the device coordinate range. If you make the window smaller than the device coordinate range, then the graPHIGS API discards (clips) the data outside of this specified range. The size of the root window is the maximum size that the workstation supports. If a window is larger than the maximum device coordinate extents, then the area beyond the extents is unused.

With the*length* and *data* parameters, your application must specify a rendering scale factor to scale primitive nominal sizes (line widths, marker sizes, edge widths, and annotation heights).This scale factor affects the nominal size for all primitives that have nominal sizes. In addition, the graPHIGS API applies this scale factor to the scale factor structure elements (i.e., marker size scale factor)When the value is set to 1.0, no scaling is performed. The specified values take effect on the next invocation of the Update Workstation (**GPUPWS**)subroutine.

Use the Inquire Mapped Display Surface Size(**GPQMDS**) subroutine to inquire the size of the mapped display surface.

This subroutine is ignored on workstations that do not use a window to display the graPHIGS API output.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

method — **specified by user, fullword integer**
Window mapping method (1=MAPPED, 2=DIRECT).

length — **specified by user, fullword integer**

Length, in bytes, of the method-dependent data (>=0).

data — **specified by user, variable length data**

Method-dependent data. Depending on the value specified by the *method* parameter, method-dependent data is as follows:

If *method* is `1=MAPPED`

N/A (no data is required).

If *method* is `2=DIRECT`

Rendering scale factor (>0.0)

A short floating-point number that specifies the rendering scale factor that the graPHIGS API uses when rendering line width, marker size, edge width, and annotation height primitives. If the value is set to 1.0, then no scaling is performed.

Error Codes

GPDMF - Set Data Morphing Factors

GPDMF (*flength, fdata*)

Purpose

Use **GPDMF** to insert a Set Data Morphing Factors structure element into the open structure following the element pointer, or to replace the element pointed at by the element pointer with a Set Data Morphing Factors structure element, depending on the current edit mode.

During traversal, the graPHIGS API combines the values of *fdata* with a primitive's data morphing vectors to modify its rendered data mapping data.

In data morphing, the graPHIGS API combines the data mapping data values $(x_1, x_2, ..., x_{ndata})$ with the data morphing scale factors in the *fdata* parameter $(s_1, s_2, ..., s_{nscale})$ and the data morphing vectors $((d_{1,1}, d_{1,2}, ..., d_{1,ndata}), (d_{2,1}, d_{2,2}, ..., d_{2,ndata}),..., (d_{n\ vector,1}, d_{nvector,2}, ..., d_{nvector,ndata}))$ to obtain the new data mapping data values $(x'_1, x'_2, ..., x'_{ndata})$ as follows:

$$x'_1 = s_1 x_1 + s_2 d_1,1 + s_3 d_{2,\ 1} +...+ s_{nscale} d_{nvector,1}$$

$$x'_2 = s_1\, x_2 + s_2\, d_1,2 + s_3\, d_2,2 + ... + s_{nscale}\, d_{nvector,2}$$

...

$$x'_{ndata} = s_1\, x_{ndata} + s_2\, d_{1,\,ndata} + s_3\, d_{2,\,ndata} + ... + s_{nscale}\, d_{\,nvector,ndata}$$

These equations show that the number of morphing scale factors should be one more than the number of morphing vectors in the affected primitive (*nscale*=*nvector*+1). However, if the number of morphing vectors and scale factors disagree at traversal time, then 0 value vectors and scale factors are assumed wherever necessary. For example, if you supply too many scale factors for a given primitive (*nscale*>*nvector*+1), then the graPHIGS API ignores the extra scale factors, as if there were additional 0 valued morphing vectors in the primitive definition. If you supply too few scale factors (*nscale*<*nvector*+1), then the graPHIGS API ignores the extra morphing vectors, just as if there were additional scale factors with value zero in this function call.

The traversal default for data morphing is *flength*=1 and *fdata*={1.0}.

Use **GPQWDT** to inquire the morphing facilities of a specified workstation.

Parameters

flength — **specified by user, fullword integer (>=1)**
　　　Number of morphing factors.

fdata — **specified by user, array of short floating-point numbers**
　　　List of morphing factors. The number of entries in this list is given by the *flength* parameter.

GPGLX2 - Set Global Transformation 2

GPGLX2 (*matrix*)

Purpose

Use **GPGLX2** to insert a two-dimensional, Set Global Transformation 2 structure element into the open structure following the element pointer or replace the element pointed at by the element pointer with a Set Global Transformation 2 structure element depending on the current edit mode.

When encountered during traversal, this element is expanded by the graPHIGS API into a 4 x 4 matrix as follows:

```
|a b c|           |a b 0 c|
|d e f|  ------>   |d e 0 f|
|g h i|           |0 0 1 0|
                  |g h 0 i|
```

and causes the expanded matrix to become the current global transformation for the current structure. The resultant matrix, in conjunction with the local modeling transformation, transforms all subsequent primitives from the Modeling Coordinate (MC) system to the World Coordinate (WC) system.

> **Note:** When inquired, the matrix returned by the Inquire Element Content (**GPQE**) subroutine is the expanded 4 x 4 matrix; the matrix returned by the Inquire List of Element Data (**GPQED**) subroutine is the 3 x 3 matrix.

Parameters

matrix — **specified by user, 9 short floating-point numbers**
> Transformation matrix (3 x 3)

> The elements must be in the following order for the input transformation matrix:

```
|m11 m12 m13|
|m21 m22 m23| ---> (m11,m12,m13,m21,m22,m23,m31,m32,m33)
|m31 m32 m33|
```

GPGLX3 - Set Global Transformation 3

GPGLX3 (*matrix*)

Purpose

Use **GPGLX3** to insert a three-dimensional, Set Global Transformation 3 structure element into the open structure following the element pointer or replace the element pointed at by the element pointer with a Set Global Transformation 3 structure element depending on the current edit mode.

When encountered during traversal, this element causes the specified matrix to replace the current global transformation for the current structure. The resultant matrix, in conjunction with the local modeling transformation, transforms all subsequent primitives from the Modeling Coordinate (MC) system to the World Coordinate (WC) system.

Parameters

matrix — **specified by user, 16 short floating-point numbers**
   Transformation matrix (4 x 4).

   The elements must be in the following order for the input transformation matrix:

```
|m11 m12 m13 m14|
|m21 m22 m23 m24|---> (m11,m12,m13,m14,m21,m22,...m44)
|m31 m32 m33 m34|
|m41 m42 m43 m44|
```

GPMCI - Set Modeling Clipping Indicator

GPMCI (*indic*)

Purpose

Use **GPMCI** to insert a Set Modeling Clipping Indicator structure element into the open structure following the element pointer, or to replace the element pointed at by the element pointer with a Set Modeling Clipping Indicator structure element, depending on the current edit mode.

Use this subroutine to set the value of the current modeling clipping indicator (*indic*). During traversal, the graPHIGS API uses the value of the modeling clipping indicator to determine whether to perform modeling clipping on subsequent output primitives.

The traversal default for the modeling clipping indicator is `1=NOCLIP`.

Not all graPHIGS API workstations support modeling clipping. Use **GPQWDT** to determine if a particular workstation supports modeling clipping.

Parameters

indic — **specified by user, fullword integer**
   Modeling clipping indicator (`1=NOCLIP`, `2=CLIP`).

Error Codes

GPMCV2 - Set Modeling Clipping Volume 2

GPMCV2 (*oper, number, lhspace*)

Purpose

Use **GPMCV2** to insert a Set Modeling Clipping Volume 2 structure element into the open structure following the element pointer, or to replace the element pointed at by the element pointer with a Set Modeling Clipping Volume 2 structure element, depending on the current edit mode.

This element modifies the current modeling clipping volume. Each modeling clipping half-space (*lhspace*) contains a point and a vector defined in modeling coordinates (MC). The graPHIGS API expands each two-dimensional half-space to a three-dimensional half-space by setting the *z* coordinate of both the point and the vector to the value 0.0.

The current modeling transformation transforms each pair of half-spaces (consisting of a point and vector) from the Modeling Coordinate (MC) system to the World Coordinate (WC) system, and defines a boundary (plane) in WC. The transformed point is on this plane and the transformed vector defines a normal to the plane which points into the acceptance half-space. The clipping volume is obtained by intersecting all acceptance half-spaces in the list specified by this element.

During traversal, the volume specified by this element either replaces or intersects the current clipping volume, depending on the value specified by the modeling clipping operator *oper*. The graPHIGS API uses the resultant clipping volume to render subsequent primitives. Transformation elements encountered during traversal do not affect the resultant clipping volume. The resultant clipping volume is called the *acceptance region* because primitives that lie within it are accepted for display. The graPHIGS API clips portions of subsequent primitives outside the acceptance region.

If the number (*number*) of modeling clipping half-spaces is set to 0, then the acceptance region is all of world coordinate space (WC).

During traversal, if the workstation does not support the specified modeling clipping operator, if the specified number of clipping half-spaces exceeds the maximum supported by the workstation, or if any half-space is found to be degenerate, then the graPHIGS API ignores this structure element.

During traversal, if the graPHIGS API encounters a Set Modeling Clipping Volume 2 or 3 structure element and the current composite modeling transformation matrix is singular, then the graPHIGS API sets the effective clipping volume to the null volume and clips all subsequent primitives.

Parameters

oper— **specified by user, fullword integer**
>Modeling clipping operator (1=`REPLACE_VOLUME`, 2=`INTERSECT_VOLUME`).

number— **specified by user, fullword integer**
>Number of modeling clipping half-spaces (>=0).

lhspace— **specified by user, array of short floating-point values**

> Modeling clipping half-spaces. Each modeling clipping half-space is defined by a point and a normal. The point and normal are specified in the order *Px, Py, Nx,* and *Ny.*

GPMCV3 - Set Modeling Clipping Volume 3

GPMCV3 (*oper, number, lhspace*)

Purpose

Use **GPMCV3** to insert a Set Modeling Clipping Volume 3 structure element into the open structure following the element pointer, or to replace the element pointed at by the element pointer with a Set Modeling Clipping Volume 3 structure element, depending on the current edit mode.

This element specifies the current modeling clipping volume. Each modeling clipping half-space (*lhspace*) contains a point and a vector defined in modeling coordinates (MC). The current modeling transformation transforms each pair of half-spaces (consisting of a point and vector) from the Modeling Coordinate (MC) system to the World Coordinate (WC) system, and defines a boundary (plane) in WC. The transformed point is on this plane, and the transformed vector defines a normal to the plane which points into the acceptance half-space. The clipping volume is obtained by intersecting all acceptance half-spaces in the list specified by this element.

During traversal, the volume specified by this element either replaces or intersects the current clipping volume, depending on the value specified by the modeling clipping operator *oper*. The graPHIGS API uses the resultant clipping volume to render subsequent primitives. Transformation elements encountered during traversal do not affect the resultant clipping volume. The resultant clipping volume is called the *acceptance region* because primitives that lie within it are accepted for display. The graPHIGS API clips portions of subsequent primitives outside the acceptance region.

If the number (*number*) of modeling clipping half-spaces is set to 0, then the acceptance region is all of world coordinate space (WC).

During traversal, if the workstation does not support the specified modeling clipping operator, if the specified number of clipping half-spaces exceeds the maximum supported by the workstation, or if any half-space is found to be degenerate, then the graPHIGS API ignores this structure element.

During traversal, if the graPHIGS API encounters a Set Modeling Clipping Volume 2 or 3 structure element and the current composite modeling transformation matrix is singular, then the graPHIGS API sets the effective clipping volume to the null volume and clips all subsequent primitives.

Parameters

oper— **specified by user, fullword integer**
>   Modeling clipping operator (1=REPLACE_VOLUME, 2=INTERSECT_VOLUME).

number— **specified by user, fullword integer**
>   Number of modeling clipping half-spaces (>=0).

lhspace— **specified by user, array of short floating-point values**

GPMLX2 - Set Modeling Transformation 2

GPMLX2 (*matrix*, *type*)

Purpose

Use **GPMLX2** to insert a two-dimensional, Set Modeling Transformation 2 structure element into the open structure following the element pointer or replace the element pointed at by the element pointer with a Set Modeling Transformation 2 structure element depending on the current edit mode.

When encountered during traversal, the 3 x 3 modeling matrix is expanded into a 4 x 4 matrix as follows:

```
|a b c|          |a b 0 c|
|d e f|  --->    |d e 0 f|
|g h i|          |0 0 1 0|
                 |g h 0 i|
```

Depending on the composition type, when this element is encountered during traversal, the specified matrix either replaces, is pre-concatenated with, or is post-concatenated with the current local modeling transformation matrix. The resultant matrix, in conjunction with the global modeling transformation, transforms all subsequent primitives from the Modeling Coordinate (MC) system to the World Coordinate (WC) system.

> **Note:** When inquired, the matrix returned by the Inquire Element Content (**GPQE**) subroutine is the expanded 4 x 4 matrix; the matrix returned by the Inquire List of Element Data (**GPQED**) subroutine is the 3 x 3 matrix.

Parameters

matrix — **specified by user, 9 short floating-point numbers**
Transformation matrix (3 x 3).

For the transformation matrix, the elements must be in the following order:

```
|m11 m12 m13|
|m21 m22 m23|  ---> (m11,m12,m13,m21,m22,m23,m31,m32,m33)
|m31 m32 m33|
```

type — **specified by user, fullword integer**
Composition type (1=PRECONCATENATE, 2=POSTCONCATENATE, 3=REPLACE)

GPRMCV - Restore Modeling Clipping Volume

GPRMCV

Purpose

Use **GPRMCV** to insert a Restore Modeling Clipping Volume structure element into the open structure following the element pointer, or to replace the element pointed at by the element pointer with a Restore Modeling Clipping Volume structure element, depending on the current edit mode.

During traversal, the Restore Modeling Clipping Volume structure element restores the current modeling clipping volume in the graPHIGS API traversal state list to:

• the volume inherited by the structure if executed via **GPEXST**

or

• the volume saved by the previous Push Set TSL (Traversal State List) subroutine (**GPPSTS** page GPPSTS - Push Set TSL)

or

• the initial modeling clipping volume.

The graPHIGS API uses this volume to clip all subsequent primitives during traversal.

GPVMF - Set Vertex Morphing Factors

GPVMF (*flength,fdata*)

Purpose

Use **GPVMF** to insert a Set Vertex Morphing Factors structure element into the open structure following the element pointer, or to replace the element pointed at by the element pointer with a Set Vertex Morphing Factors structure element, depending upon the edit mode.

During traversal, the graPHIGS API combines the value of *fdata* with a primitive's vertex morphing values to modify its rendered vertex coordinates.

In vertex morphing, the graPHIGS API combines the vertex coordinate values *(x, y, z)* with the vertex morphing scale factors in the *fdata* parameter (s_1, s_2, ..., s_{nscale}) and the vertex morphing vectors

$((dx_1, dy_1, dz_1), (dx_2, dy_2, dz_2), ..., (dx_{nvector}, dy_{nvector}, dz_{nvector}))$

to create the new vertex coordinate values (x', y', z') as follows:

$x' = s_1 x + s_2 dx_1 + s_3 dx_2 + ... + s_{nscale} dx_{nvector}$

$y' = s_1 y + s_2 dy_1 + s_3 dy_2 + ... + s_{nscale} dy_{nvector}$

$z' = s_1 z + s_2 dz_1 + s_3 dz_2 + ... + s_{nscale} dz_{nvector}$

These equations show that the number of morphing scale factors should be one more than the number of morphing vectors in the affected primitive (*nscale=nvector*+1). However, if the number of morphing vectors and scale factors disagree at traversal time, then 0 value vectors and scale factors are assumed wherever necessary. For example, if you supply too many scale factors for a given primitive (*nscale>nvector*+1), then the graPHIGS API ignores the extra scale factors, as if there were additional 0 valued morphing vectors in the primitive definition. If you supply too few scale factors (*nscale<nvector*+1), then the graPHIGS API ignores the extra morphing vectors, just as if there were additional morphing scale factors with value zero in this function call.

The traversal default for vertex morphing is *flength*=1 and *fdata*={1.0}.

Use **GPQWDT** to inquire the morphing facilities of a specified workstation.

Parameters

flength — **specified by user, fullword integer (>=1)**
    Number of morphing factors.

fdata — **specified by user, array of short floating-numbers**
    List of morphing factors. The number of entries in this list is given by the *flength* parameter.

Chapter 11. Input Subroutines

Input subroutines allow users to supply input to your application. There are six logical input device classes: locator, stroke, valuator, choice, pick, and string. There are three modes of interaction with the input devices: sample, request, and event. Input subroutines also allow a program to emulate physical device input for one or more logical devices.

The subroutines discussed in this section perform the following operations:

- initialization of an input device
- setting the operating mode of an input device
- requesting input from a device
- sampling an input device's current value
- managing the event queue
- retrieving input values from the event queue
- emulating a physical device
- defining a cursor.

To determine the actual input capabilities of a specific workstation, use the inquire subroutines (see Chapter 16 ″Inquire Subroutines″).

GPAWEV - Await Event

GPAWEV (*time*, *major*, *class*, *minor*)

Purpose

Use **GPAWEV** to move the next event from the event queue into the current event report. If the input queue is empty, the graPHIGS API is placed in a wait state until at least one of the following occurs:

1. An event is added to the event queue.
2. The time specified in the timeout parameter has elapsed.
3. An error is reported by any nucleus connected to the shell.

If the time value is zero, no wait takes place. If the time value is not zero, a wait takes place for the specified time interval. The maximum time interval is 55,800 seconds (15.5 hours).

The timing is done using the operating system's timing facility. (See *The graPHIGS Programming Interface: Writing Applications*.)

When a timeout or error situation occurs, the graPHIGS API returns zero for the event class parameter and major/minor code parameters are not set. Otherwise, the graPHIGS API returns the major code, class, and minor code of the event in the current event report. For the details of event class, major/minor codes and event data, see *The graPHIGS Programming Interface: Technical Reference (POWER-based System Only)*.

The application must use the appropriate Get subroutine call to obtain the value(s) of the input residing in the current event report.

Parameters

time — **specified by user, short floating-point number**
    Timeout interval in seconds (>=0.0).

317

major — **returned by the graPHIGS API, fullword integer**
    Major event code.

class — **returned by the graPHIGS API, fullword integer**
    Event class.

minor — **returned by the graPHIGS API, fullword integer**
    Minor event code.

Error Codes

147	EVENT QUEUE HAS OVERFLOWED
151	TIMEOUT VALUE < ZERO
168	INPUT DEVICE IS CURRENTLY OWNED BY ANOTHER CONNECTION
532	TIME INTERVAL IS TOO LARGE

Note: The operation is performed even if error 147 occurs.

GPBKAC - Set Break Action

GPBKAC (*wsid*, *trigger*)

Purpose

Use **GPBKAC** to set the break action to a given trigger type and trigger qualifier at the specified workstation.

This subroutine lets the application specify which operator action is to be interpreted as ″break″ for input device operations on the given workstation. For example, the default break action on the 5080 workstation is the alternate-cancel key combination.

The break action is the operator action that terminates an outstanding Request input subroutine at a workstation. This break action is used to terminate Request operations for all device classes.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

trigger — **specified by user, 2 fullword integers**
> Trigger to be used on the specified workstation for the break action. The trigger consists of a trigger type followed by a trigger qualifier. Positive integers as trigger types are button type physical device numbers. The trigger qualifier for a button device is the physical button number. If a trigger type is for a keyboard and the qualifier is between 0 and 255, the workstation's primary character set is used to interpret the qualifier.

Error Codes

GPCHMO - Set Choice Mode

GPCHMO (*wsid*, *device*, *mode*, *echosw*)

Purpose

Use **GPCHMO** to set the operating mode of a choice input device.

After the choice mode is set, its echoing state is set to `1=NOECHO` or `2=ECHO` based on the *echosw* parameter. Depending on the specified operating mode, `1=REQUEST,` `2=SAMPLE,` or `3=EVENT`, an interaction with the given device may begin or end.

> **Note:** The input device is reset with the initialization values when the **GPCHMO** subroutine is called with *mode* parameters set to SAMPLE or EVENT.

Parameters

wsid — **specified by user, fullword integer**
      Workstation identifier.

device — **specified by user, fullword integer**
      Choice device number.

mode — **specified by user, fullword integer**
      Operating mode (`1=REQUEST, 2=SAMPLE, 3=EVENT`).

echosw — **specified by user, fullword integer**
      Echo switch (`1=NOECHO, 2=ECHO`).

Error Codes

GPCUR - Set Cursor Representation

GPCUR (*wsid*, *index*, *format*, *shape*)

Purpose

Use **GPCUR** to set the cursor shape into the specified cursor shape table entry of the specified workstation.

Parameters

wsid — **specified by user, fullword integer**
      Workstation identifier.

index — **specified by user, fullword integer**
      Cursor shape table index (>=1).

format — **specified by user, fullword integer**
      Format of the cursor definition in *shape*.

Valid formats are:

1 -   Fixed Size Raster, 1 bit per pixel.

>=2 -   Reserved.

shape — **specified by user, variable data**

Cursor definition data. This parameter contains the information required to define a cursor shape. The content of this parameter is interpreted according to the *format* parameter.

Type 1 cursor format requires a rectangular array of pixels, each 1 bit deep. A value of one in a pixel location indicates that the cursor color should be displayed for the screen pixel which is overlayed by the cursor pixel. A value of zero indicates that the underlying screen pixel should not be modified or overlayed. The following syntax is required for this format:

Field	Offset (bytes)	Length (bytes)	Type/Interpretation
ncol	0	4	fullword integer. *x* size of pixel array (number of columns)
nrow	4	4	fullword integer. *y* size of pixel array (number of rows)
pixels	8	(ncol+31)/32*nrow*4	Array of bits, 1/pixel. Each row starts on a word (32 bit) boundary.

For this format, the *x* size and *y* size of the specified pixel array must match the maximum pixel array size as returned by the Inquire Cursor Facilities (**GPQCUF**) subroutine.

Error Codes

25	SPECIFIED WORKSTATION DOES NOT EXIST
37	WORKSTATION IS NOT OF CATEGORY OUTIN
181	CURSOR PIXEL ARRAY SIZE IS INVALID
182	CURSOR SHAPE TABLE INDEX NOT WITHIN WORKSTATION TABLE RANGE
183	SPECIFIED CURSOR FORMAT IS NOT SUPPORTED

Related Subroutines

GPQCUF	Inquire Cursor Facilities

RCP code

201344772 (X'0C004704')

GPCUS - Set Cursor Shape

GPCUS (*wsid*, *ctype*)

Purpose

Use **GPCUS** to select a cursor definition from the workstation's cursor shape table. The graPHIGS API uses this definition for the graphics cursor of the input devices which are controlled by a two-dimensional

vector type physical input device. The cursor definition selected by this subroutine is used as a prompt of every input device which has a prompt that is the graphic cursor.

Optional cursor definitions include, full screen cross hair, disable (none), two color logical input, and user-defined. Only workstations which use the facilities of a window system (e.g., X-Windows) can specify none (-2) or two color cursor logical input (-3). A cursor definition of (-2) (none) allows the application to disable the graPHIGS API cursors and to use the cursor facilities of the window system instead.

The default cursor is a single color cursor with a shape type of zero. This is compatible with Version 1 of the graPHIGS API.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

ctype — **specified by user, fullword integer**
> Cursor definition. This parameter must contain one of the following values that are available on the workstation:

-3	Two color cursor logical input.
-2	None.
-1	Full screen cross hair cursor.
0	Logical input device dependent cursor.
>=1	User defined cursor shape. This value is used as an index to the workstation's cursor shape table and the cursor pointed to by this index is used as the graphical cursor.

Error Codes

25	SPECIFIED WORKSTATION DOES NOT EXIST
37	WORKSTATION IS NOT OF CATEGORY OUTIN
180	CURSOR SHAPE TYPE IS NOT SUPPORTED
182	CURSOR SHAPE TABLE INDEX NOT WITHIN WORKSTATION TABLE RANGE

GPEPD - Emulate Physical Device

GPEPD (*wsid*, *category*, *device*, *value*)

Purpose

Use **GPEPD** to emulate input from a physical device to one or more logical input devices. The set of logical input devices which will receive this physical input is fixed.

The physical device must first be disabled before it can be emulated through this subroutine. An error is generated otherwise.

If you are using physical device emulation on the X workstation, refer to *The graPHIGS Programming Interface: Technical Reference.*

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

category — **specified by user, fullword integer**
> Physical device category (1=BUTTON, 2=SCALAR, 3=2D_VECTOR).

device — **specified by user, fullword integer**
> Physical device number (>=1).

value — **specified by user, array of fullword integers**
> Input values. This array contains a list of values that are to be passed to the measure mapping process of the logical input devices that receive their input from the specified physical device. The length and content of this array is determined by the category of physical input device as follows:

Category	Number of values to be passed in
1=BUTTON	1
2=SCALAR	1
3=2D_VECTOR	2

> If the physical device generates **absolute values**, then the specified *value* must be in the range defined for the physical input device. To determine the range for the physical input device, use Inquire Physical Device Characteristics (**GPQPDC**) subroutine.

> If the physical device generates **relative values**, then the specified *value* can by any positive or negative integer which represents increments of physical motion. The value is used to compute a **change** in the measure of the logical device using the following formula:

```
                    Logical Range high  - Logical Range low
------------------------------------------------------------------------------- x value
#of Physical Device Increments / Unit of Physical Motion x #Units of Physical Motion
```

> The **change** is then added to the current measure of the logical device. If the result exceeds a limit of the range, then the measure is set to that limit.

> **Logical Range**
>> Specified on the Initialize Device subroutine call. It is the range of physical input values that the logical device can input.

> **Unit of Physical Motion**
>> For a dial physical device, a unit of physical motion equals one turn of the dial (unless this is changed by the Initialize Valuator [**GPINVL**] [page GPINVL - Initialize Valuator] subroutine). For a relative vector device, the WDT range of the device's physical motion equals the amount of motion necessary to move the cursor from one edge of the screen to its opposite edge.

>> **Note:** For keyboard physical devices, if the *value* is between 0 and 255, the workstation's primary character set is used to interpret the *value*.

GPEVHN - Define Event Handling Subroutine

GPEVHN (*event-handler*, *anchor*)

Purpose

Use **GPEVHN** to specify the address of an application-defined event handling procedure.

If the specified application event handler routine address is not zero, the graPHIGS API gives control to the routine for each event received by the shell from any connecting nucleus. When the routine address is zero, the graPHIGS API performs event handling without calling any application defined event handler.

The application event handler defined by this subroutine is invoked from the graPHIGS API event handling routine running in a special run time environment. The environment depends on the operating system on which the graPHIGS API shell is running and on the communication mechanism used to communicate with each nucleus. If two graPHIGS API nuclei are connected to the graPHIGS API shell and communication methods for these nuclei are different, the application event handler may be invoked in two different environments. Therefore, the application event handler:

- Must be written in a programming language which is environment independent.
- Must follow the standard linkage convention of the operating system on which the graPHIGS API shell is running.
- Must not issue any graPHIGS API subroutine call.
- Should not issue nor invoke any system subroutine which may require the normal run time environment.
- Must return to the graPHIGS API event handler.

For the details of event class, major/minor codes and event data, see *The graPHIGS Programming Interface: Technical Reference*.

When the application event handler is invoked, it receives the following parameters by the ″call by reference mechanism″ via the operating system's standard linkage convention. The application event handler should never modify any parameter other than the return flag:

anchor — **variable data**
> Application anchor. This is the second parameter of the **GPEVHN** subroutine. Anchor is a user defined data area that the graPHIGS API passes to your event handler. The parameter is passed without any checking or modification.

major — **fullword integer**
> Major code of the event.

class — **fullword integer**
> Event class of the event.

minor — **fullword integer**
> Minor code of the event.

length — **fullword integer**
> Length of event data in bytes.

data — **variable length data**
> Event data. For the format of event data see *The graPHIGS Programming Interface: Technical Reference*.

sflag — **fullword integer**
> Status flag. Flags representing the event queue status. The following bits are set:

> **bit 0-28**
>> Reserved, is set to 0.

> **bit 29** Event queue space flag (`1=NO_MORE_SPACE_AVAILABLE`, `0=SPACE_AVAILABLE`).

> **bit 30** Event queue overflow flag (`1=ALREADY_OVERFLOWED`, `0=NOT_OVERFLOWED_YET`). When this bit is 1, bit 29 is always 1.

> **bit 31** More simultaneous event flag (`1=MORE_SIMULTANEOUS_EVENT`, `0=NO_MORE_SIMULTANEOUS_EVENT`).

rflag — **fullword integer**
> Return flag. Flags specifying required operations. The following bits should be set:

bit 0-30	Reserved, should be set to 0.
bit 31	Discard flag (`1=SHOULD_BE_DISCARDED`, `0=SHOULD_BE_ENQUEUED`). Even if the application specifies 0 for this bit, the event is discarded when there is no more space available, that is, when bit 29 of the status flag is 1. If this situation occurs in the process of simultaneous events, it also causes deletion of all events within the simultaneous event group and the event queue enters an overflow state. Note that in the case of queue overflow the deletion of a set of simultaneous events includes deletion of events already reported to the application event handler.

Parameters

event-handler — **specified by user, fullword integer**
> Address of the application event handler routine or a fullword integer of 0.

anchor — **specified by user, variable data**
> Parameter to be passed back to the application event handler. Anchor is for user defined data.

GPFLEV - Flush Device Event

GPFLEV (*wsid*, *class*, *device*)

Purpose

Use **GPFLEV** to discard all input events from the specified logical input device.

All events received from the specified input device, matching the specified device class, workstation identifier and device number, are removed from the event queue.

If the current event report includes an event matching the specified input device, the current event report is also removed.

Parameters

wsid — **specified by user, fullword integer**
    Workstation identifier (event major code).

class — **specified by user, fullword integer**
    Device class (1=LOCATOR, 2=STROKE, 3=VALUATOR, 4=CHOICE, 5=PICK, 6=STRING).

device — **specified by user, fullword integer**
    Device number (event minor code).

Error Codes

25   SPECIFIED WORKSTATION DOES NOT EXIST

GPFWEV - Flush Workstation Event

GPFWEV (*wsid*)

Purpose

Use **GPFWEV** to discard all events from the specified workstation.

All events from the specified workstation, with an event class range between 1 and 200 will be removed from the event queue. All other events with classes greater than 200 will remain on the event queue.

If the current event report includes an event from the specified workstation, the current event report is also removed.

For information about events, see *The graPHIGS Programming Interface: Technical Reference*.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier (event major code).

Error Codes

25   SPECIFIED WORKSTATION DOES NOT EXIST

147   EVENT QUEUE HAS OVERFLOWED

> **Note:** The operation is performed even if error 147 occurs.

GPGTLC - Get Locator

GPGTLC (*view*, *pos*)

Purpose

Use **GPGTLC** to retrieve a locator input value from the current event report. The event is not removed from the current event report until the next invocation of the Await Event (**GPAWEV**) subroutine.

The view index indicates the view table entry whose matrix was used to convert the locator point to World Coordinates (WC). This was the view active for input with the highest input priority at the indicated screen location.

The device to which this value corresponds was identified on the previous invocation of **GPAWEV**.

Locator input is returned from the view active for input with the highest input priority under the cursor. View zero is the highest priority view unless modified by your application.

Parameters

view — **returned by the graPHIGS API, fullword integer**
        View index.

pos — **returned by the graPHIGS API, 3 short floating-point numbers (WC)**
        Locator position.

GPGTMS - Get Message

GPGTMS (*ilen*, *olen*, *string*)

Purpose

Use **GPGTMS** to retrieve a message string from the current event report. The event is not removed from the current event report until the next invocation of the Await Event (**GPAWEV**) subroutine.

Parameters

ilen — **specified by user, fullword integer**
> Length of the message to be returned in bytes. This value specifies the size of array provided in the *string* parameter. If the message length in the current event report is longer than this length, the overage is truncated.

olen — **returned by the graPHIGS API, fullword integer**
> Length of the message actually returned in bytes.

string — **returned by the graPHIGS API, variable length character string.**
> A character string supplied by the sender.

GPGTPK - Get Pick

GPGTPK (*length*, *depth*, *pickpath*)

Purpose

Use **GPGTPK** to retrieve a pick input value from the current event report. The event is not removed from the current event report until the next invocation of the Await Event (**GPAWEV**) subroutine.

This value consists of a pick path describing the position of the picked primitive in the structure network. The pick path is returned in the order specified in the Initialize Pick (**GPINPK**) subroutine, that is, 1=TOP_FIRST or 2=BOTTOM_FIRST. If **GPINPK** has not been called, the default value is 1=TOP_FIRST.

The device to which this value corresponds was identified on the previous invocation of **GPAWEV** (like other Get subroutines).

Parameters

length — **specified by user, fullword integer**
> Length of the array provided by the application for return of the pick path data (>=0).

> This value is specified as the size of the pick path array in *pickpath* entries. Each entry in the path is three fullword integers. If the actual pick information is longer than the pick path array provided by the application, the overage is truncated.

depth — **returned by the graPHIGS API, fullword integer**
> Depth of pick path returned in the *pickpath* parameter.

> This value is specified as the size of the pick path array in *pickpath* entries. Each entry in the path is three fullword integers.

pickpath — **returned by the graPHIGS API, array of fullword integers**
> Array containing the pick path. The array consists of structure identifier, pick identifier, and element number triplets, making up the path to the picked primitive. The path is returned in the order specified by the initialize pick subroutine.

> If the actual pick information is longer than the *pickpath* array provided by the application, then the overage is truncated.

> Pick path data is set in the *pickpath* parameter in the following order: Entry 1, Entry 2, ...Entry N.

```
         -----------------------------------------------------------
Entry 1  |  Structure ID 1  |   Pick ID 1  |    Element #1     |
                                                                
Entry 2  |  Structure ID 2  |   Pick ID 2  |    Element #2     |
                                                                
   .     |        .         |      .       |        .          |
   .     |        .         |      .       |        .          |
   .     |        .         |      .       |        .          |
                                                                
Entry N  |  Structure ID N  |   Pick ID N  |    Element #N     |

GPGTSK - Get Stroke

GPGTSK (*length*, *view*, *npoint*, *pointlist*)

Purpose

Use **GPGTSK** to retrieve a stroke input device value from the current event report. The event is not removed from the current event report until the next invocation of the Await Event (**GPAWEV**) subroutine.

The number of points returned is limited to the current input buffer size found in the stroke data record at the time the device was placed in event mode. The view index indicates the view table entry whose matrix was used to convert the stroke points to World Coordinates (WC). This view was the view active for input with the highest input priority containing all the stroke locations.

The device to which this value corresponds was identified on the previous invocation of **GPAWEV**.

Stroke input is returned from the view active for input with the highest input priority which contains all the points. View 0 is the highest priority view, unless modified by your application.

Parameters

length — **specified by user, fullword integer**
> Length of point list array provided by application for the return of the stroke points. This value is specified as the maximum number of points that can be stored in the *pointlist* (>=0).

view — **returned by the graPHIGS API, fullword integer**
> View index.

npoint — **returned by the graPHIGS API, fullword integer**
> Number of points returned in the *pointlist*.

pointlist — **returned by the graPHIGS API, array of short floating-point numbers (WC)**
> Coordinates of points in initial stroke buffer.
>
> The points are ordered similarly to the *pointlist* parameters on output primitives.

GPGTST - Get String

GPGTST (*ilen*, *olen*, *string*)

Purpose

Use **GPGTST** to retrieve a string input value from the current event report. The event is not removed from the current event report until the next invocation of the Await Event (**GPAWEV**) subroutine.

The length of the returned string is less than, or equal to, the buffer size found in the string data record at the time the device was placed in event mode.

The device to which this value corresponds was identified on the previous invocation of **GPAWEV**.

Parameters

ilen — **specified by user, fullword integer**
    Length of string array in bytes provided by application to return string data (>=0).

olen — **returned by the graPHIGS API, fullword integer**
    Length of the character string actually returned in bytes.

string — **returned by the graPHIGS API, variable length character string**
    Character string.

Error Codes

GPGTVL - Get Valuator

GPGTVL (*value*)

Purpose

Use **GPGTVL** to retrieve a valuator input value from the current event report. The event is not removed from the current event report until the next invocation of the Await Event (**GPAWEV**) subroutine.

The value returned is in the range found in the valuator record at the time that the device was placed in event mode.

The device to which this value corresponds was identified on the previous invocation of **GPAWEV**.

Parameters

value — **returned by the graPHIGS API, short floating-point number**
    Value of logical valuator when event was triggered.

Error Codes

150   GET FUNCTION DOES NOT MATCH CURRENT EVENT CLASS

519   NO CURRENT EVENT REPORT AVAILABLE

GPGTXP - Get Extended Pick

GPGTXP (*maxdepth*, *view*, *point*, *modelling*, *depth*, *pickpath*)

Purpose

Use **GPGTXP** to retrieve a pick input value from the current event report. The event is not removed from the current event report until the next invocation of the Await Event (**GPAWEV**) subroutine.

This subroutine can be used only for the pick event generated by a pick input device with the extended pick device type. For the pick event generated by a pick input device with the normal pick device type, the Get Pick (**GPGTPK**) subroutine should be used.

Parameters

maxdepth — **specified by user, fullword integer**
   Maximum pick path depth to be returned (>=1). This value specifies the size of the array provided in the *pickpath* parameter in the unit of four fullwords. If the actual pick information is longer than the pick path array provided by the application, the overage is truncated.

view — **returned by the graPHIGS API, fullword integer**
   Index of the view where the pick event occurred.

point — **returned by the graPHIGS API, 3 short floating-point numbers**
   Position of the center of pick aperture in NPC when the pick event occurred. For the normal pick input device such as a tablet, only the *x* value and the *y* value are meaningful. *z* value always contains a constant (0).

modelling — **returned by the graPHIGS API, 16 short floating-point numbers**
   Composite modelling transformation applied to the picked primitive.

depth — **returned by the graPHIGS API, fullword integer**
   Depth of the actual pick path returned.

pickpath — **returned by the graPHIGS API, array of fullword integers**
   Pick path for picked primitive. List of pick path quadruples. Each quadruple represents a structure identifier, pick identifier, label and element number of the picked primitive or an execute structure element of the *pickpath*. The path is returned in the order specified by the Initialize Pick (**GPINPK**) subroutine. Pick path data is set in the *pickpath* parameter in the following order: Entry 1, Entry 2, ...Entry N.

```
         ---------------------------------------------------------------
Entry 1  |  Structure ID 1  | Pick ID 1  |  Label #1    |  Element #1   |
                                                         
Entry 2  |  Structure ID 2  | Pick ID 2  |  Label #2    |  Element #2   |
                                                         
   .     |        .         |     .      |      .       |       .       |
   .     |        .         |     .      |      .       |       .       |
   .     |        .         |     .      |      .       |       .       |
                                                         
Entry N  |  Structure ID N  | Pick ID N  |  Label #N    |  Element #N   |
         ---------------------------------------------------------------
```

GPGWIN - Get Window

GPGWIN (*ilen*, *olen*, *data*)

Purpose

Use **GPGWIN** to retrieve the workstation event data from the current event report. The event is not removed from the current event report until the next invocation of the Await Event (**GPAWEV**) subroutine.

The data returned in the *data* parameter is defined by the event class of the current event. The event class is returned as an output parameter on **GPAWEV**, or can be obtained using the Inquire Current Event (**GPQCEV**) subroutine.

Parameters

ilen — **specified by user, fullword integer**
> The length of the data area in bytes provided by the application to return the window event data (>=0).

olen — **returned by the graPHIGS API, fullword integer**
> The length, in bytes, of the window event data actually returned.

data — **returned by the graPHIGS API, variable-length data**
> Window event data. The format and contents of the returned data depends on the class of the window event. The supported data are:

Event Class 105 - Window Resize Notification Event

```
                 -------------------
    WORDS 1-3  |   display size    |   3 floating-point numbers
                 -----------------
    WORDS 4-6  |    addr units     |   3 fullword integers
                 -------------------
```

display size - 3 floating-point numbers
> Window size in device coordinates.

addr units - 3 fullword integers
> Window size in address units. This event is enabled by using the Escape (**GPES**) subroutine with function 1009 (Window Resize Notification Control).

Event Class 106 - Window Expose Event

```
                    -------------------
        WORD 1   |      vflags       |  0 - 31 bits
                    -------------------
        WORD 2   |      vflags       | 32 - 63 bits
                    -------------------
```

vflags - Variable length byte string
View expose flags. There is one flag bit in the byte string for each view on the workstation. The view index can be used to directly access the corresponding flag bit. The maximum number of views supported on workstations is currently 64. Therefore, the maximum number of bytes returned is currently 8 bytes.

Each flag bit can have one of the following values:
- 0 - the view is not effected by the expose event.
- 1 - the view is effected by the expose event.

This event is enabled by using the Escape (**GPES**) subroutine with function 1011 (Window Exposure Notification Control).

GPICS - Set Input Character Set

GPICS (*wsid*, *class*, *device*, *csid*)

Purpose

Use **GPICS** to set the character set identifier for the specified input device on the workstation. The identifier specifies the character set used to interpret character data received from or sent to the logical input device.

This subroutine is valid only when the specified device is in Request mode.

In addition, the input character set affects the display of the initial string. For example, this subroutine can be used to specify the language used for string device echo.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

class — **specified by user, fullword integer**
Device class (1=LOCATOR, 2=STROKE, 3=VALUATOR, 4=CHOICE, 5=PICK, 6=STRING).

device **— specified by user, fullword integer**
  Device number (>=1).

csid **— specified by user, fullword integer**
  Character set identifier.

  See Appendix A. ″Character Set and Font Identifiers″ for more information.

> **Note:** The supported character set identifier is workstation dependent. See *The graPHIGS Programming Interface: Technical Reference* for details.

GPIDMO - Set Input Device Mode

> GPIDMO (*wsid*, *class*, *device*, *state*, *deact*, *echosw*, *trigger*, *break*, *reset*)

Purpose

Use **GPIDMO** to set the operating mode of the specified logical input device on the specified workstation.

The operating mode consists of six individual switches. Your application can set each of these switches individually to a specified value. Set a switch to zero to preserve its previous setting.

When an application process issues this subroutine and sets the mode of an inactive device to 2=ACTIVE, the application becomes the owner of the active device. While the device is owned, the graPHIGS API rejects any attempt by any other application process to activate the device. The application process is owner of the device until it performs some action that deactivates the device.

The graPHIGS API sends an input event to the application when the state switch (*state*) of the logical device is set to 2=ACTIVE and one of the following conditions exists:

- The primary trigger of a logical device fires and the primary trigger switch (*trigger*) is set to 2=ON. Additionally, if the auto deactivate switch (*deact*) is set to 2=ON, then the graPHIGS API deactivates the device.
- The workstation's break action fires and its break action switch (*break*) is set to 2=ON. Additionally, the graPHIGS API deactivates the device.

For a description of the events returned as a result of a trigger firing or a break action, see *The graPHIGS Programming Interface: Technical Reference*.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

class — **specified by user, fullword integer**
Input device class (1=LOCATOR, 2=STROKE, 3=VALUATOR, 4=CHOICE, 5=PICK, 6=STRING).

device — **specified by user, fullword integer**
Logical input device number (>=1).

state — **specified by user, fullword integer**
State switch (1=DEVICE_INACTIVE, 2=DEVICE_ACTIVE). Set this parameter to a value of zero to preserve the current state switch.

deact — **returned by the graPHIGS API, fullword integer**
Auto deactivate switch (1=OFF, 2=ON). Set this parameter to a value of zero to preserve the current auto deactivate switch.

When the primary trigger of a logical device fires and an event is sent to the application, the graPHIGS API deactivates the device if its auto deactivate switch is set to 2=ON.

echosw — **returned by the graPHIGS API, fullword integer**
Echo switch (1=NOECHO, 2=ECHO).

trigger — **returned by the graPHIGS API, fullword integer**
Primary trigger switch (1=OFF, 2=ON). Set this parameter to a value of zero to preserve the current trigger switch.

When the primary trigger of a logical device fires and its trigger switch is set to 2=ON, the graPHIGS API sends an input event to the application.

break — **returned by the graPHIGS API, fullword integer**
Break switch (1=OFF, 2=ON). Set this parameter to a value of zero to preserve the current break switch.

When the workstation's break action fires, the graPHIGS API deactivates all active logical devices on the workstation that have their break swtiches set to 2=ON. Additionally, the graPHIGS API sends a break action to the application for each of the devices.

reset — **returned by the graPHIGS API, fullword integer**
Auto reset switch (1=OFF, 2=ON). Set this parameter to a value of zero to preserve the current auto reset switch.

When an input event is sent to the application for a logical input device, the graPHIGS API resets its device measure to its initial value if the auto reset switch is set to 2=ON.

GPIEC - Set Input Echo Color

GPIEC (*wsid*, *color*)

Purpose

Use **GPIEC** to change the echo color for all input devices on the specified workstation.

This subroutine is assigned escape identifier 1006.

> **Note:** This subroutine is an escape subroutine, and therefore, may not be available on all workstations. Use the Inquire List of Available Escape Subroutines (**GPQES**) subroutine to determine if this subroutine is supported by a specific workstation.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

color — **specified by user, 3 short floating-point numbers**
Echo color. This parameter contains three color components which are interpreted in the color space defined by the current workstation color model (0.0<=*color*<=1.0).

Error Codes

GPINCH - Initialize Choice

GPINCH (*wsid*, *device*, *choice*, *echo*, *area*, *datalen*, *data*)

Purpose

Use **GPINCH** to specify initial values for a given choice device.

The Initialize Choice subroutine stores the initial choice number, prompt/echo type, echo area, and data record in the workstation state list for the specified device. For a keyboard choice device, an initial choice number less than 256 is interpreted using the workstation's input device character set. For details on the specific devices available on different workstation types, see *The graPHIGS Programming Interface: Technical Reference* or use the appropriate inquiry subroutines.

> **Note:** The choice device must be in Request mode.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

device — **specified by user, fullword integer**
> Choice device number (>=1).

choice — **specified by user, fullword integer**
> Initial choice number (>=0).

echo — **specified by user, fullword integer**
> Prompt/echo type (>=1).

area — **specified by user, 6 short floating-point numbers (DC)**
> Echo area (Xmin, Xmax, Ymin, Ymax, Zmin, Zmax).

datalen — **specified by user, fullword integer**
> Data record length.

> > **Note:** The data record length parameter must equal zero (*datalen*=0) if no data record is required for the given prompt/echo type. For prompt/echo types which require a data record, the specified data record length must be greater than, or equal to, 12.

data — **user specified, variable data**
> Choice data record.

Prompt/echo Types

Type One
> designates the current choice number using a workstation-dependent technique.

Type Two
> lets you indicate choice numbers by invoking the prompting capability.

> Physical input devices commonly used as choice logical input devices have a built-in prompting capability. If the value of the i(th) element of the prompt array in the choice data record is `1=OFF`, prompting of the i(th) alternative of the specified choice input device is turned off. An value of `2=ON` indicates that prompting for that alternative is turned on. Choice echo Type Two requires the following data record:

```
                 ---------------------------
          0 |            n             |   number of integers
             |--------------------------|
          4 |            0             |   number of reals
             |--------------------------|
          8 |            0             |   number of strings
   -------- |--------------------------|
         12 |    prompt for choice 1   |
    |        |--------------------------|
integers    /                          /
    |       /                          /
    |        |--------------------------|
    | n*4+12 |    prompt for choice n   |
   -------- ---------------------------
```

Prompt values are `1=OFF`, `2=ON`.

GPINLC - Initialize Locator

GPINLC (*wsid*, *device*, *view*, *pos*, *echo*, *area*, *datalen*, *data*)

Purpose

Use **GPINLC** to initialize the specified locator device.

The Initialize Locator subroutine stores the initial locator position, initial view index, prompt/echo type, echo area, and locator data record in the workstation state list for the specified device.

Two positions are required for some locator prompt/echo types: the initial locator position, which remains fixed during input operation, and the current locator position, which varies dynamically as you use the locator.

> **Note:** The locator device must be in Request mode.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

device — **specified by user, fullword integer**
> Locator device number (>=1).

view — **specified by user, fullword integer**
> Initial view index (>=0)

pos — **specified by user, 3 short floating-point numbers (WC)**
> Initial locator position.

echo — **specified by user, fullword integer**
> Prompt/echo type (>=1).

area — **specified by user, 6 short floating-point numbers (DC)**
> Echo area (Xmin, Xmax, Ymin, Ymax, Zmin, Zmax).

datalen — **specified by user, fullword integer**
> Data record length.

> > **Note:** The data record length parameter must equal zero (*datalen*=0) if no data record is required for the given prompt/echo type. For prompt/echo types which require a data record, the specified data record length must be greater than, or equal to, 12.

data — **specified by user, variable length data**
> Locator data record.

Prompt/echo Types

Type One
> designates the current position of the locator using a workstation-dependent technique.

Type Two
> the crosshair, designates the current position of the locator by spanning the display surface or device echo area with both a vertical and a horizontal line. The lines intersect at the current locator position. Whether the crosshair spans the entire display surface or only the echo area depends on the capabilities of the workstation.

Type Three
> designates the current position of the locator using a tracking cross.

Type Four
> designates the current position of the locator using a rubber band line connecting the initial locator position given by this subroutine and the current locator position. If no attributes are specified within the data record, workstation dependent defaults are used.

> Type Four requires the following data record:

```
                 -----------------------------
          0  |        0 or 1 or 7          |  Number of integers
                 -----------------------------
          4  |          0 or 1            |  Number of reals
                 -----------------------------
          8  |             0              |  Number of strings
     --------  -----------------------------
         12  |  attribute control flag ** |  0=NO ATTRIBUTES SPECIFIED
                                              1=ATTRIBUTES SPECIFIED

         16  |        linetype ASF*       |
                 -----------------------------  |  1=BUNDLED
         20  | linewidth scale factor ASF*|  |  2=INDIVIDUAL
 integers    -----------------------------
         24  |  polyline color index ASF *|  |
```

```
        |          |--------------------------|----
        |       28 |     polyline index *     |  <---- Bundle table index
        |          |--------------------------|----
        |       32 |     linetype index *     |     |
        |          |--------------------------|     Individual
        |       36 |   polyline color index * |     attribute
        --------   |--------------------------|     settings
  real -----> 40 |   linewidth scale factor * |     |
                   |--------------------------|----
```

        * Polyline Attributes
        Only present if attribute control flag=1
        ** Attribute Control Flag
        Only present if number of integers >0

Type Five

designates the current position of the locator using a rubberband rectangle. The diagonal of the rectangle forms a line connecting the initial locator position given by this subroutine and the current locator position. If no attributes are specified within the data record, workstation dependent defaults are used.

Type Five requires the following data record:

```
               --------------------------
            0|      0 or 1 or 16        |  Number of integers
             --------------------------
            4|        0 or 1           |  Number of reals
             --------------------------
            8|          0              |  Number of strings

```

        * Polygon Attributes

```
              Only present if attribute control flag=1
              **  Attribute Control Flag
              Only present if number of integers >0
```

Type Seven

designates the current position of the locator using a specified structure network attached to the tracking cross.

The structure identifier of the root structure to be dragged is specified in the data record and, optionally, the World Coordinate (WC) point on the structure to which the locator is attached. If the attachment point is not specified, the point (0, 0, 0) is used. If for the attachment point, only *x*, *y* coordinates are specified, a *z* coordinate of zero is used. The structure to be dragged must be associated with the workstation before it can be attached to the locator device.

The structure is conceptually dragged in Viewing Coordinate (VC) space, before the view projection is applied. The structure definition may vary while the locator is active. For example, the application may choose to scale the structure as it is dragged using a modeling transformation. The dragged structure network is clipped to the locator device echo area.

Type Seven requires the following data record:

```
               ---------------------------
          0    |            1            | Number of integers
               ---------------------------
          4    |        0, 2 or 3        | Number of reals
               ---------------------------
          8    |            0            | Number of strings
               ---------------------------
integer--->12  |   structure identifier  |
          ---- ---------------------------
      |   16  |     X coordinate  (WC)  |
      |       ---------------------------
reals |   20  |     Y coordinate  (WC)  |
      |       ---------------------------
      |   24  |     Z coordinate  (WC)  |
          ---- ---------------------------
```

GPINPK - Initialize Pick

> GPINPK (*wsid*, *device*, *depth*, *pickpath*, *echo*, *area*, *datalen*, *data*, *order*)

Purpose

Use **GPINPK** to initialize the specified pick device.

The Initialize Pick subroutine stores the prompt/echo type, echo area, initial pick path depth, initial pick path, pick data record and pick path order in the workstation state list for the specified device.

> **Note:** The pick device must be in Request Mode.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

device — **specified by user, fullword integer**
> Pick device number (>=1).

depth — **specified by user, fullword integer**
> Initial pick path depth (>=0).

pickpath — **specified by user, array of fullword integers**
> Initial pick path. Specified as a list of triplets where each triplet represents the structure identifier, pick identifier, and element number of the initial path.

> Pick path data is set in the *pickpath* parameter in the following order: Entry 1, Entry 2, ...Entry N.

```
          ---------------------------------------------------------
Entry 1  |  Structure ID 1   |  Pick ID 1   |   Element #1        |
         |                   |              |                     |
Entry 2  |  Structure ID 2   |  Pick ID 2   |   Element #2        |
         |                   |              |                     |
   .     |        .          |      .       |        .            |
   .     |        .          |      .       |        .            |
   .     |        .          |      .       |        .            |
         |                   |              |                     |
Entry N  |  Structure ID N   |  Pick ID N   |   Element #N        |
          ---------------------------------------------------------
```

> **Note:** The initial pick path is ignored.

echo — **specified by user, fullword integer**
> Prompt/echo type (>=1).

area — **specified by user, 6 short floating-point numbers (DC)**
    Echo area (Xmin, Xmax, Ymin, Ymax, Zmin, Zmax).

datalen — **specified by user, fullword integer**
    Data record length in bytes (>=0).

> **Note:** The data record length parameter must equal zero (*datalen*=0) if no data record is
> required for the given prompt/echo type. For prompt/echo types which require a data record,
> the specified data record length must be greater than or equal to 12.

*data* — **specified by user, variable data**
    Pick data record.

order — **specified by user, fullword integer**
    Pick path order for returning subsequent pick input values (1=TOP_FIRST, 2=BOTTOM_FIRST). The
    default value is 1=TOP_FIRST.

Prompt/echo Types

Type One
    uses a workstation-dependent technique that highlights the picked primitive. No data record is
    required.

GPINSK - Initialize Stroke

GPINSK (*wsid*, *device*, *view*, *npoint*, *width*, *pointlist*, *echo*, *area*, *buflen*, *editpos*, *datalen*, *data*)

Purpose

Use **GPINSK** to initialize the specified stroke device.

The Initialize Stroke subroutine stores the initial stroke, initial view index, prompt/echo type, echo area and stroke data record in the workstation state list for the specified device.

For all prompt/echo types, the input buffer size is compared to the maximum input buffer size for stroke devices on that workstation. If the requested buffer size is greater, the maximum buffer size for stroke devices is substituted in the stored record. If the initial stroke is longer than the buffer size, an error is issued.

When a stroke measure process begins, it acquires a buffer of the current input buffer size. The initial stroke pointlist is copied into this buffer, and the editing position is placed at the initial buffer editing position. The replacement of points begins at this initial position. The *x*, *y,z* and time intervals (where possible) of the data record control the frequency and density of stroke points.

　　　　Note: The stroke device must be in Request mode.

Parameters

wsid **— specified by user, fullword integer**
　　　　Workstation identifier.

device **— specified by user, fullword integer**
　　　　Stroke device number (>=1).

view **— specified by user, fullword integer**
　　　　Initial view index (>=0).

npoint **— specified by user, fullword integer**
　　　　Number of points in initial stroke (>=0).

width **— specified by user, fullword integer**
　　　　Number of fullwords between subsequent *x* values in the initial pointlist (>=3).

pointlist **— specified by user, array of short floating-point numbers (WC)**
　　　　Coordinates of initial stroke points specified as a list of three-dimensional points.

echo — **specified by user, fullword integer**
Prompt/echo type (>=1).

area — **specified by user, 6 short floating-point numbers (DC)**
Echo area (Xmin, Xmax, Ymin, Ymax, Zmin, Zmax).

buflen — **specified by user, fullword integer**
Stroke input buffer size (>=0). This value is specified as the maximum number of points the user may enter into the stroke input buffer.

editpos — **specified by user, fullword integer**
Editing position within the initial stroke buffer (1<=*editpos*<= *npoint +1*).

datalen — **specified by user, fullword integer**
Data record length, in bytes (>=0).

> **Note:** The data record length parameter must equal zero (*datalen*=0) if no data record is required for the given prompt/echo type. For prompt/echo types which require a data record, the specified data record length must be greater than, or equal to, 12.

data — **specified by user, variable data**
Stroke data record.

Prompt/echo Types

Type One

displays the current stroke using a workstation-dependent technique. Stroke echo Type One requires the following data record:

```
              ---------------------------
          0   |          0              |  Number of integers
              ---------------------------
          4   |          4              |  Number of reals
              ---------------------------
          8   |          0              |  Number of strings
        ----- ---------------------------
          |  12  |     x interval (WC)   |
          |      -------------------------
          |  16  |     y interval (WC)   |
  reals   |      -------------------------
          |  20  |     z interval (WC)   |
          |      -------------------------
          |  24  |  time interval (>=0)  |
        ----- ---------------------------
```

Type Three

displays a marker at each point of the current stroke. The marker representation is selected by a marker index entry, which is stored in the stroke data record.

Stroke echo Type Three requires the following data record:

```
             ----------------------------
         0   |         1 or 7           |  Number of integers
             ----------------------------
         4   |         4 or 5           |  Number of reals
             ----------------------------
         8   |           0              |  Number of strings
       ----  ----------------------------
          |  12  |  attribute control flag  | 0=NO ATTRIBUTES SPECIFIED
          |      |                          | 1=ATTRIBUTES SPECIFIED
          |      ---------------------------- ----

       |  |---------------------------|
       |48|       z interval (WC)      |
       |  |---------------------------|
       |52|time interval (>=0)         |
       |  |---------------------------|----  |
       |56|  marker size scale factor* |      |---
  ------ ----------------------------- ---
```
        * Polymarker Attributes
          only present if attribute control flag=1

Type Four

displays a line joining successive points in the current stroke. A polyline index entry in the stroke data record selects the line representation used.

Stroke echo Type Four requires the following data record:

```
           -----------------------------
       0 |          1 or 7           | Number of integers
         |---------------------------|

GPINST - Initialize String

GPINST (*wsid, device, length, string, echo, area, buflen, cursor, datalen, data*)

Purpose

Use **GPINST** to initialize the specified string input device.

The Initialize String subroutine stores the initial string, prompt/echo type, echo area, and string data record in the workstation state list for the specified device. The string device's input character set is used to interpret the initial string and prompt strings.

The input string returned is the size of the string input buffer (*buflen*). However, if your application specifies a prompt/echo type 2 (*echo*) and the *buflen* size *plus* the prompt are greater than the device's maximum buffer size, then the input string returned will be the device's maximum buffer size *minus* the prompt string.

>   **Note:** The string device must be in Request mode.

Parameters

wsid — **specified by user, fullword integer**
>   Workstation identifier of the device to be initialized.

device — **specified by user, fullword integer**
>   String device number (>=1).

length — **specified by user, fullword integer**
>   Length of initial string, in bytes (>=0).

string — **specified by user, variable length character string**
>   Initial string.

echo — **specified by user, fullword integer**
>   Prompt/echo type to be initialized (>=1).

area — **specified by user, 6 short floating-point numbers (DC)**
>   Echo area (Xmin, Xmax, Ymin, Ymax, Zmin, Zmax).

buflen — **specified by user, fullword integer**
>   String input buffer size, in bytes (>=0).

cursor — **specified by user, fullword integer**
>   Initial cursor position in the string buffer relative to the position of the initial string (>=1). If a prompt string is used (echo type=2), the initial string is placed in the string buffer immediately after the prompt string. Otherwise, the initial string is placed at position one in the string buffer.
>
>   If the string input buffer size parameter is zero, the initial cursor position parameter is not checked, and the graPHIGS API uses the value of zero for the initial position.

datalen — **specified by user, fullword integer**
>   Data record length, in bytes (>=0).
>
>>   **Note:** The data record length parameter must equal zero (*datalen*=0) if no data record is required for the given prompt/echo type. For prompt/echo types which require a data record, the specified data record length must be greater than or equal to 12.

data — **specified by user, variable data**
>   String data record.
>
>   For all prompt/echo types the input buffer size is compared to maximum input buffer size for string devices in the WDT. If the requested buffer size is greater, the maximum input buffer size for string devices is substituted in the stored record. If the initial string is longer than the buffer size, an error is issued.

Prompt/echo Types

Type One
>   displays the current string value within the echo area using a workstation-dependent technique.

Type Two
>   displays an application-specified prompt string which precedes the initial string. This prompt string

is passed in by way of the data record and is placed in the string device input buffer. It is not returned to the user. The prompt may not be typed over and is not returned with the string device input. The initial cursor position is specified relative to the initial string position in the string buffer.

String echo Type Two requires the following data record:

```
                     ---------------------------
        0       |             0             |   Number of integers
                     ---------------------------
        4       |             0             |   Number of reals
                     ---------------------------
        8       |             1             |   Number of strings
  Character      ---------------------------
  string 12 ----->  |        prompt string      |
                     ---------------------------
```
The prompt string includes the length of the string in the first byte of the input. This length (in bytes) is inclusive of the length field. Therefore, a length of one specifies a null prompt string.

___

GPINVL - Initialize Valuator

GPINVL (*wsid*, *device*, *ivalue*, *echo*, *area*, *lovalue*, *hivalue*, *datalen*, *data*)

Purpose

Use **GPINVL** to initialize the specified valuator device.

The Initialize Valuator subroutine stores the initial value, prompt/echo type, echo area, and valuator data record in the WSL entry for the specified workstation.

For all valuator prompt/echo types a low value and a high value specify the range for input from that valuator. The values from the physical device are scaled linearly to the specified range.

> **Note:** The valuator device must be in Request mode.

Parameters

wsid — **specified by user, fullword integer**
    Workstation identifier of the device to be initialized.

device — **specified by user, fullword integer**
    Valuator device number to be initialized (>=1).

ivalue — **specified by user, short floating-point number**
    Initial value.

echo — **specified by user, fullword integer**
    Prompt/echo type (>=1).

area — **specified by user, 6 short floating-point numbers (DC)**
    Echo area (Xmin, Xmax, Ymin, Ymax, Zmin, Zmax).

lovalue — **specified by user, short floating-point number**
    Low end of range for valuator.

hivalue — **specified by user, short floating-point number**
    High end of range for valuator.

datalen — **specified by user, fullword integer**
    Data record length, in bytes (>=0)

> **Note:** The data record length parameter must equal zero (*datalen*=0) if no data record is required for the given prompt/echo type. For prompt/echo types which require a data record, the specified data record length must be greater than, or equal to, 12.

data — **specified by user, variable data**
    Valuator data record.

Prompt/echo Types
- **Type One** designates the current valuator value using a workstation-dependent technique.
- **Type Three** displays a digital representation of the current valuator value within the echo area.

- **Type Four** passes a data record containing the number of turns of the dial to be mapped onto the specified valuator range. The current valuator value is designated using a workstation-dependent technique.

  Valuator echo Type Four requires the following data record:

  ```
                  ---------------------------
          0      |            1              |  Number of integers
                  ---------------------------
          4      |            0              |  Number of reals
                  ---------------------------
          8      |            0              |  Number of strings
                  ---------------------------
  integer 12 --> |       number of turns     |
                  ---------------------------
  ```

    Note: For emulation purposes, one turn of the dial equals one unit of physical motion.

GPIPKC - Set Initial Pick Correlation State

GPIPKC (*wsid, device, state*)

Purpose

Use **GPIPKC** to change the initial pick correlation state of the pick device.

Similar to other input device initialization subroutines, **GPIPKC** can only be called when the device is in Request mode, and takes effect the next time the device becomes active.

This subroutine is assigned escape identifier 1004.

> **Note:** This subroutine is an escape subroutine and therefore may not be available on all workstations. Use the Inquire List of Available Escape Subroutines (**GPQES**) subroutine, to determine if this subroutine is supported by a specific workstation.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

device — **specified by user, fullword integer**
> Device number (>=1).

state — **specified by user, fullword integer**
> Initial pick correlation state (`1=OFF`, `2=ON`).

Error Codes

GPIT - Set Input Device Trigger

GPIT (*wsid*, *class*, *devnum*, *listid*, *tnum*, *triglist*)

Purpose

Use **GPIT** to set the input device trigger for a given input device at the specified workstation. The specified trigger list replaces the current trigger list for the input device. Similar to other input device initialization subroutines, **GPIT** can only be called when the device is in Request mode, and takes effect the next time the device becomes active.

The primary trigger (trigger list identifier zero) always exists and causes the input to be returned to the application. Secondary triggers (trigger list identifiers beginning with 1) provide the user additional control of the device measure. For example, secondary trigger 3, for stroke device #2 on the 5080 workstation,

causes a point to be added to the input buffer. The number of secondary triggers for a given input device can be determined programmatically using the Inquire Number of Secondary Triggers (**GPQNST**) subroutine.

Not all input devices let the trigger be programmed. This information, as well as the supported trigger types and qualifiers, can be determined using the Inquire Input Trigger Capabilities (**GPQIT**) subroutine.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

class — **specified by user, fullword integer**
> Input device class (1=LOCATOR, 2=STROKE, 3=VALUATOR, 4=CHOICE, 5=PICK, 6=STRING).

devnum — **specified by user, fullword integer**
> Device number (>0).

listid — **specified by user, fullword integer**
> Trigger list identifier (>=0).

tnum — **specified by user, fullword integer**
> Number of entries in the trigger list which follows (>=0). The primary trigger list must always contain at least one entry. A secondary trigger may have an empty trigger list (zero entries), in which case the trigger is always inoperative.

triglist — **specified by user, array of fullword integers**
> List of trigger descriptor triplets. The list is an array of trigger descriptors in which each descriptor consists of 3 fullword integers designating the trigger type, low trigger qualifier, and high trigger qualifier. The trigger type field has the following meanings:

Type   **Meaning**

-1   Change of the measure of the corresponding physical input device.

> This type is valid only for the primary (0) trigger list identifier.

> The low qualifier specifies the granularity of movement which causes the trigger to fire. The granularity is specified as the amount that the physical device measure must change since the last trigger was fired in order for the trigger to be fired again. The high qualifier must be zero.

0   Reserved for an implementation dependent trigger that is only valid as the default value. This value cannot be specified.

>0   Physical device number within the button category.

> The trigger qualifiers for this trigger type are a range of choices on the indicated physical device. Trigger qualifiers less than 256 for keyboard trigger types are interpreted using the device's input character set. The parameter *tnum* identifies the number of triplets (trigger descriptors) in the trigger list.

GPLCMO - Set Locator Mode

GPLCMO (*wsid*, *device*, *mode*, *echosw*)

Purpose

Use **GPLCMO** to set the operating mode of the specified locator device.

After the Locator Mode is set, its echoing state is set to 1=NOECHO or 2=ECHO, based on the *echosw* parameter. Depending on the specified operating mode, 1=REQUEST, 2=SAMPLE, or 3=EVENT, an interaction with the given device may begin or end.

> **Note:** The input device is reset with the initialization values when the **GPLCMO** subroutine is called with *mode* parameters set to SAMPLE or EVENT.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

device — **specified by user, fullword integer**
Locator device number (>=1).

mode — **specified by user, fullword integer**
Operating mode (1=REQUEST, 2=SAMPLE, 3=EVENT).

echosw — **specified by user, fullword integer**
Echo switch (1=NOECHO, 2=ECHO).

GPPDMO - Set Physical Device Mode

> **GPPDMO (*wsid*, *category*, *device*, *mode*)**

Purpose

Use **GPPDMO** to enable or disable the physical input device from generating input values to the set of logical input devices to which it is connected.

The default state of all physical devices is `2=ENABLED`, if the physical device is actually present. The set of physical devices that are connected to a specific logical input device can be obtained by issuing the Inquire Source Physical Device (**GPQSPD**) subroutine.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

category — **specified by user, fullword integer**
> Physical device category (`1=BUTTON, 2=SCALAR, 3=2D_VECTOR`).

device — **specified by user, fullword integer**
> Physical device number (>=1).

mode — **specified by user, fullword integer**
> Physical device mode (`1=DISABLED, 2=ENABLED`).

GPPKAP - Set Pick Aperture

GPPKAP (*wsid*, *device*, *size*)

Purpose

Use **GPPKAP** to set the pick aperture size for the specified pick device.

The aperture is a square the length of whose side is specified by the *size* parameter in Device Coordinates (DC).

> **Note:** The pick device must be in Request mode.

Parameters

wsid — **specified by user, fullword integer**
    Workstation identifier of pick device.

device — **specified by user, fullword integer**
    Pick device number (>=1)

size — **specified by user, short floating-point number (DC)**
    Aperture size (>=0)

    This is specified as the length of a side of a square in Device Coordinates.

Error Codes

GPPKF - Set Pick Filter

GPPKF (*wsid, device, inclen, incl, exclen, excl*)

Purpose

Use **GPPKF** to set the pick inclusion and exclusion filters for the given pick device.

The filters consist of class names which indicate to the specified workstation which class names to include and which to exclude from pickability (detectability).

Parameters

wsid — **specified by user, fullword integer**
    Workstation identifier.

device — **specified by user, fullword integer**
    Pick device number (>=1).

inclen — **specified by user, fullword integer**
    Inclusion filter list length (>=0).

incl — **specified by user, array of fullword integers**
    List of class names (>=0).

exclen — **specified by user, fullword integer**
    Exclusion fliter list length (>=0).

excl — **specified by user, array of fullword integers**
    List of class names (>=0).

GPPKMO - Set Pick Mode

GPPKMO (*wsid, device, mode, echosw*)

Purpose

Use **GPPKMO** to set the operating mode of the specified pick device.

After the pick mode is set, its echoing state is set to 1=NOECHO or 2=ECHO based on the *echosw* parameter. Depending on the specified operating mode, 1=REQUEST, 2=SAMPLE, or 3=EVENT, an interaction with the given device may begin or end.

> **Note:** The input device is reset with the initialization values when the **GPPKMO** subroutine is called with *mode* parameters set to SAMPLE or EVENT.

Parameters

wsid — **specified by user, fullword integer**
      Workstation identifier.

device — **specified by user, fullword integer**
      Pick device number (>=1)

mode — **specified by user, fullword integer**
      Operating mode (1=REQUEST, 2=SAMPLE, 3=EVENT)

echosw — **specified by user, fullword integer**
      Echo switch (1=NOECHO, 2=ECHO)

Error Codes

25   SPECIFIED WORKSTATION DOES NOT EXIST

140   DEVICE NUMBER < ONE OR DEVICE NOT AVAILABLE

GPPKSC - Set Pick Selection Criteria

GPPKSC (*wsid*, *device*, *criteria*)

Purpose

Use **GPPKSC** to set the criteria that is used to select the primitive(s) that are to be accumulated during pick correlation.

As with other input device control subroutines, **GPPKSC** can only be called when the specified input device is in Request mode.

If a workstation does not support hidden line/hidden surface removal, then the graPHIGS API ignores the visible aspect of the criteria. Therefore, criteria 4-6 behaves as criteria 1-3.

This subroutine is assigned escape identifier 1005.

> **Note:** This subroutine is an escape subroutine and therefore may not be available on all workstations. Use the Inquire List of Available Escape Subroutines (**GPQES**) subroutine to determine if this subroutine is supported by a specific workstation. See also the workstation description information in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

wsid **— specified by user, fullword integer**
    Workstation identifier.

device **— specified by user, fullword integer**
    Device number (>=1).

criteria **— specified by user, fullword integer**
    Pick selection criteria (1=FIRST, 2=LAST, 3=ALL, 4=FIRST_VISIBLE, 5=LAST_VISIBLE, 6=ALL_VISIBLE). 1=FIRST and 2=LAST refer to the order in which views, structures and elements are traversed for output.

GPRQCH - Request Choice

GPRQCH (*wsid*, *device*, *status*, *choice*)

Purpose

Use **GPRQCH** to have the graPHIGS API execute a request to the specified choice device. The choice input value, which is the current measure of the choice device, is returned.

A status of 1=NONE means that a break action occurred.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

device — **specified by user, fullword integer**
> Choice device number (>=1).

status — **returned by the graPHIGS API, fullword integer**
> Status (`1=NONE`, `2=OK`).

choice — **returned by the graPHIGS API, fullword integer**
> Choice number.
>
> A choice number of zero means no choice.

GPRQLC - Request Locator

```
GPRQLC (wsid, device, status, view, pos)
```

Purpose

Use **GPRQLC** to have the graPHIGS API execute a request to the specified locator device.

The locator position and the index of the view whose matrix was used to convert the location to World Coordinates (WC) are returned.

Locator input is returned from the view active for input with the highest input priority under the cursor. View 0 is the highest priority view, unless modified by your application.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

device — **specified by user, fullword integer**
> Locator device number (>=1).

status — **returned by the graPHIGS API, fullword integer**
> Status (1=NONE, 2=OK).

view — **returned by the graPHIGS API, fullword integer**
> View index.

pos — **returned by the graPHIGS API, 3 short floating-point numbers (WC)**
> Locator position.

Error Codes

GPRQPK - Request Pick

GPRQPK (*wsid*, *device*, *length*, *status*, *depth*, *pickpath*)

Purpose

Use **GPRQPK** to have the graPHIGS API execute a request to the specified pick device.

The pick path information is returned in the order specified in the Initialize Pick (**GPINPK**) subroutine, that is, 1=TOP_FIRST or 2=BOTTOM_FIRST. If **GPINPK** has not been called, the default value is 1=TOP_FIRST.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

device — **specified by user, fullword integer**
> Pick device number (>=1).

length — **specified by user, fullword integer**
> Length of pick path array provided by the application in which the graPHIGS API returns the pick information (>=0).

> This value is specified as the size of the pick path array in pick path entries. If the actual pick information is longer than the *pickpath* array provided by the application, the overage is truncated.

status — **returned by the graPHIGS API, fullword integer**
> Status (1=NONE, 2=OK).

depth — **returned by the graPHIGS API, fullword integer**

 Depth of pick path returned in the *pickpath* parameter.

pickpath — **returned by the graPHIGS API, array of fullword integers**

 Pick path to picked primitive. List of pick path triplets. Each triplet represents the structure identifier, the pick identifier, and the element number of the pick path.

 If the actual pick information is longer than the pick path array provided by the application, the overage is truncated.

 Pick path data is returned in the *pickpath* parameter in the following order: Entry 1, Entry 2, ...Entry N.

```
         ----------------------------------------------------------
Entry 1  |  Structure ID 1  |  Pick ID 1  |    Element #1      |
                                                              
Entry 2  |  Structure ID 2  |  Pick ID 2  |    Element #2      |
                                                              
   .            .                 .               .
   .            .                 .               .
   .            .                 .               .
                                                              
Entry N  |  Structure ID N  |  Pick ID N  |    Element #N      |

GPRQSK - Request Stroke

GPRQSK (*wsid*, *device*, *length*, *status*, *view*, *npoint*, *pointarray*)

Purpose

Use **GPRQSK** to have the graPHIGS API execute a request to the specified stroke device.

The graPHIGS API returns a sequence of World Coordinate (WC) points and the view table index whose matrix was used to convert the stroke locations to World Coordinates (WC).

Stroke input is returned from the view active for input with the highest input priority that contains all the points. View 0 is the highest priority view, unless modified by your application.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

device — **specified by user, fullword integer**
Stroke device number (>=1).

length — **specified by user, fullword integer**
Length of *pointarray* provided by the application for the graPHIGS API to return stroke data (>=0).

This value is specified as the size of the *pointarray* in point entries.

status — **returned by the graPHIGS API, fullword integer**
Status (`1=NONE`, `2=OK`).

view — **returned by the graPHIGS API, fullword integer**
View table index.

npoint — **returned by the graPHIGS API, fullword integer**
Number of points returned in point array (>=0).

pointarray — **returned by the graPHIGS API, array of short floating-point numbers (WC)**
Coordinates (3D) of points in stroke returned as a pointlist of width=3.

GPRQST - Request String

GPRQST (*wsid*, *device*, *length*, *status*, *number*, *string*)

Purpose

Use **GPRQST** to have the graPHIGS API execute a request to the specified string device.

The graPHIGS API returns a character string from the device.

Parameters

wsid — **specified by user, fullword integer**
    Workstation identifier.

device — **specified by user, fullword integer**
    String device number (>=1).

length — **specified by user, fullword integer**
    Length of string array in bytes provided by the application for the graPHIGS API to return the string information (>=1).

status — **returned by the graPHIGS API, fullword integer**
    Status of string input (1=NONE, 2=OK).

number — **returned by the graPHIGS API, fullword integer**
    Number of bytes returned.

string — **returned by the graPHIGS API, variable length character string**
    Character string.

GPRQVL - Request Valuator

GPRQVL (*wsid*, *device*, *status*, *value*)

Purpose

Use **GPRQVL** to have the graPHIGS API execute a request to the specified valuator device.

The value returned is in the range specified by your application through the Initialize Valuator (**GPINVL**) subroutine.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

device — **specified by user, fullword integer**
> Valuator device number (>=1).

status — **returned by the graPHIGS API, fullword integer**
> Status of valuator input (`1=NONE`, `2=OK`).

value — **returned by the graPHIGS API, short floating-point number**
> Value.

GPRQXP - Request Extended Pick

GPRQXP (*wsid*, *device*, *maxdepth*, *status*, *view*, *point*, *modelling*, *depth*, *pickpath*)

Purpose

Use **GPRQXP** to have graPHIGS API execute a request to the specified pick device. This subroutine can be used only for a pick device which provides the extended pick information. For a pick device which does

not return the extended information, the Request Pick (**GPRQPK**) subroutine should be used. The Inquire Pick Measure Type (**GPQPKT**) subroutine can be used to determine if the pick device provides the extended pick information.

The pick path information is returned in the order specified in the Initialize Pick (**GPINPK**) subroutine that is, `1=TOP_FIRST` or `2=BOTTOM_FIRST`. If **GPINPK** has not been called, the default value is `1=TOP_FIRST`.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

device — **specified by user, fullword integer**
> Pick device number (>=1).

maxdepth — **specified by user, fullword integer**
> Length of pick path array provided by the application in which the graPHIGS API returns the pick information (>=0).
>
> This value is specified as the size of the pick path array in terms of pick path entries.

status — **returned by the graPHIGS API, fullword integer**
> Status (`1=NONE, 2=OK`).

view — **returned by the graPHIGS API, fullword integer**
> Index of the view which was used to render the instance of the primitive that was picked.

point — **returned by the graPHIGS API, 3 short floating-point numbers**
> Position of the center of the pick aperture in NPC when the pick was detected. For the typical physical input device that is used to drive the logical pick device (for example, tablet), only the *x* and *y* values are meaningful. The *z* value always contains a constant (0).

modelling — **returned by the graPHIGS API, 16 short floating-point numbers**
> Composite modelling transformation that was used to transform the instance of the primitive that was picked.

depth — **returned by the graPHIGS API, fullword integer**
> Depth of the pick path returned in the *pickpath* parameter.

pickpath — **returned by the graPHIGS API, array of fullword integers**
> Pick path for picked primitive. List of pick path quadruples. Each quadruple represents a structure identifier, pick identifier, label and element number of the picked primitive or an execute structure element of the *pickpath*. Pick path data is returned in the order (`1=TOP_FIRST, 2=BOTTOM_FIRST`) that was last set through an Initialize Pick (**GPINPK**) subroutine.
>
> If the actual pick information is longer than the *pickpath* array provided by the application, the overage is truncated. Pick path data is returned in the *pickpath* parameter in the following order: Entry 1, Entry 2, ...Entry N.

```
         ----------------------------------------------------------------
 Entry 1 |  Structure ID 1  |  Pick ID 1  |  Label #1  |  Element #1   |
         |                  |             |            |               |
 Entry 2 |  Structure ID 2  |  Pick ID 2  |  Label #2  |  Element #2   |
         |                  |             |            |               |
    .    |        .         |      .      |     .      |      .        |
    .    |        .         |      .      |     .      |      .        |
    .    |        .         |      .      |     .      |      .        |

GPSKMO - Set Stroke Mode

GPSKMO (*wsid*, *device*, *mode*, *echosw*)

Purpose

Use **GPSKMO** to set the operating mode of the specified stroke device.

After the stroke mode is set, its echoing state is set to `1=NOECHO` or `2=ECHO` based on the *echosw* parameter. Depending on the specified operating mode, `1=REQUEST`, `2=SAMPLE`, or `3=EVENT`, an interaction with the given device may either begin or end.

> **Note:** The input device is reset with the initialization values when the **GPSKMO** subroutine is called with *mode* parameters set to SAMPLE or EVENT.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

device — **specified by user, fullword integer**
> Stroke device number (>=1).

mode — **specified by user, fullword integer**
> Operating mode (`1=REQUEST`, `2=SAMPLE`, `3=EVENT`).

echosw **— specified by user, fullword integer**
    Echo switch (`1=NOECHO`, `2=ECHO`).

GPSMLC - Sample Locator

GPSMLC (*wsid*, *device*, *view*, *pos*)

Purpose

Use **GPSMLC** to immediately retrieve the current measure of the specified locator device.

The measure consists of a locator position in World Coordinates (WC), and the index of the view table entry whose matrix was used to convert the location to World Coordinates.

Locator input is returned from the view active for input with the highest input priority under the cursor. View 0 is the highest priority view, unless modified by your application.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

device — **specified by user, fullword integer**
Locator device number (>=1).

view — **returned by the graPHIGS API, fullword integer**
View table index.

pos — **returned by the graPHIGS API, 3 short floating-point numbers (WC)**
Locator position.

GPSMPK - Sample Pick

GPSMPK (*wsid*, *device*, *length*, *depth*, *pickpath*)

Purpose

Use **GPSMPK** to immediately retrieve the current measure of the specified pick device.

The *pickpath* information is returned in the order specified in the Initialize Pick (**GPINPK**) subroutine, that is, 1=TOP_FIRST or 2=BOTTOM_FIRST. If **GPINPK** has not been called, the default value is 1=TOP_FIRST.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

device — **specified by user, fullword integer**
Pick device number (>=1).

length — **specified by user, fullword integer**
Length of pick path array provided by the application in which the graPHIGS API returns the pick information (>=0).

This value is specified as the size of the pick path array in pick path entries. If the actual pick information is longer than the *pickpath* array provided by the application, the overage is truncated.

depth — **returned by the graPHIGS API, fullword integer**
Depth of the pick path returned in the *pickpath* parameter.

A depth of the actual pick path equal to zero indicates no pick.

pickpath — **returned by the graPHIGS API, array of fullword integers**
Pick path to picked primitive. List of pick path triplets where each triplet represents the structure identifier, the pick identifier and the element number of the pick path.

The pick path is returned in the order specified in the initialize pick subroutine, that is, `1=TOP_FIRST` or `2=BOTTOM_FIRST`.

If the actual pick information is larger than the *pickpath* array provided by the application, the overage is truncated.

```

Purpose

Use **GPSMSK** to immediately retrieve the current measureof the specified stroke device.

This measure consists of a sequence of stroke positions (not exceeding the current input buffer size) in World Coordinates (WC), and the index of the view table entry whose matrix was used to convert the stroke locations to World Coordinates.

Stroke input is returned from the view active for input with the highest input priority which contains all the points. View 0 is the highest priority view, unless modified by your application.

Parameters

wsid — **specified by user, fullword integer**
    Workstation identifier.

device — **specified by user, fullword integer**
    Stroke device number (>=1).

length — **specified by user, fullword integer**
    Length of *pointarray* provided by the application for the graPHIGS API to return stroke information (>=0) This value is specified as the size of the *pointarray* in point entries.

view — **returned by the graPHIGS API, fullword integer**
    View table index.

npoint — **returned by the graPHIGS API, fullword integer**
    Number of points in the stroke measure.

pointarray — **returned by the graPHIGS API, array of short floating-point numbers (WC)**
    Coordinates of points in the stroke returned as a pointlist of width=3.

Error Codes

25   SPECIFIED WORKSTATION DOES NOT EXIST

GPSMST - Sample String

GPSMST (*wsid*, *device*, *length*, *number*, *string*)

Purpose

Use **GPSMST** to retrieve the current measure of the specified string device.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

device — **specified by user, fullword integer**
> String device number (>=1).

length — **specified by user, fullword integer**
> Length, in bytes, of string array provided by the application in which the graPHIGS API returns the string data (>=0).

number — **returned by the graPHIGS API, fullword integer**
> Number of bytes returned.

string — **returned by the graPHIGS API, variable length character string**
> Character string.

Error Codes

25   SPECIFIED WORKSTATION DOES NOT EXIST

140   DEVICE NUMBER < ONE OR DEVICE NOT AVAILABLE

505   LENGTH OF RETURN ARRAY < ZERO

GPSMVL - Sample Valuator

GPSMVL (*wsid*, *device*, *value*)

Purpose

Use **GPSMVL** to retrieve the current measure of the specified valuator device.

The delivered value is in the range specified for this device through the Initialize Valuator (**GPINVL**) subroutine.

Parameters

wsid **— specified by user, fullword integer**
Workstation identifier.

device **— specified by user, fullword integer**
Valuator device number (>=1).

value **— returned by the graPHIGS API, short floating-point number**
Value.

Error Codes

25   SPECIFIED WORKSTATION DOES NOT EXIST

140   DEVICE NUMBER < ONE OR DEVICE NOT AVAILABLE

Related Subroutines

GPSMXP - Sample Extended Pick

GPSMXP (*wsid*, *device*, *maxdepth*, *view*, *point*, *modelling*, *depth*, *pickpath*)

Purpose

Use **GPXMSP** to immediately retrieve the current measure of the specified pick device. This subroutine can be used only for a pick device which provides the extended pick information. For a pick device which does not return the extended information, the Sample Pick (**GPSMPK**) subroutine should be used. The Inquire Pick Measure Type (**GPQPKT**) subroutine can be used to determine if the pick device provides the extended pick information.

The pick path information is returned in the order specified in the Initialize Pick (**GPINPK**) subroutine, that is, 1=TOP_FIRST or 2=BOTTOM_FIRST. If **GPINPK** has not been called, the default value is 1=TOP_FIRST.

Parameters

wsid **— specified by user, fullword integer**
Workstation identifier.

device **— specified by user, fullword integer**
Pick device number (>=1).

maxdepth **— specified by user, fullword integer**
Length of pick path array provided by the application in which the graPHIGS API returns the pick information (>=0).

This value is specified as the size of the pick path array in terms of pick path entries.

view — **returned by the graPHIGS API, fullword integer**
> Index of the view which was used to render the instance of the primitive that was picked.

point — **returned by the graPHIGS API, 3 short floating-point numbers**
> Position of the center of the pick aperture in NPC when the pick was detected. For the typical physical input device that is used to drive the logical pick device (for example, tablet), only the *x* and *y* values are meaningful. The *z* value will always contain a constant (0).

modelling — **returned by the graPHIGS API, 16 short floating-point numbers**
> Composite modelling transformation that was used to transform the instance of the primitive that was picked.

depth — **returned by the graPHIGS API, fullword integer**
> Depth of the pick path returned in the *pickpath* parameter.

pickpath — **returned by the graPHIGS API, array of fullword integers**
> Pick path for picked primitive. List of pick path quadruples. Each quadraple represents a structure identifier, pick identifier, label and element number of the picked primitive or an execute type structure element of the *pickpath* Pick path data is returned in the order (1=TOP_FIRST, 2=BOTTOM_FIRST) that was last set through an Initialize Pick (**GPINPK**) subroutine.
>
> If the actual pick information is longer than the pick path array provided by the application, the overage is truncated. Pick path data is returned in the *pickpath* parameter in the following order: Entry 1, Entry 2, ...Entry N.

```
        ----------------------------------------
Entry 1 | Structure ID 1 | Pick ID 1 | Label #1 | Element #1 |

Entry 2 | Structure ID 2 | Pick ID 2 | Label #2 | Element #2 |

    .   |       .        |     .     |    .     |     .      |
    .   |       .        |     .     |    .     |     .      |
    .   |       .        |     .     |    .     |     .      |

Entry N | Structure ID N | Pick ID N | Label #N | Element #N |
        ----------------------------------------
```

GPSTMO - Set String Mode

GPSTMO (*wsid*, *device*, *mode*, *echosw*)

Purpose

Use **GPSTMO** to set the operating mode of the specified string device.

After the string mode is set, its echoing state is set to 1=NOECHO or 2=ECHO based on the *echosw* parameter. Depending on the specified operating mode, 1=REQUEST, 2=SAMPLE or 3=EVENT, an interaction with the given device may either begin or end.

> **Note:** The input device is reset with the initialization values when the **GPSTMO** subroutine is called with *mode* parameters set to SAMPLE or EVENT.

Parameters

wsid — **specified by user, fullword integer**
        Workstation identifier.

device — **specified by user, fullword integer**
        String device number (>=1).

mode — **specified by user, fullword integer**
        Operating mode (1=REQUEST, 2=SAMPLE, 3=EVENT).

echosw — **specified by user, fullword integer**
        Echo switch (1=NOECHO, 2=ECHO).

Chapter 12. Font Subroutines

Font subroutines let the application program manage a workstation's font resources.

Through the use of Font directories, fonts may be loaded to the directory and shared by workstation resources.

GPACFO - Activate Font

> **GPACFO(*wsid*, *csid*, *font*)**

Purpose

Use **GPACFO** to activate a geometric text font to the specified workstation. If the specified character set/font pair is already active, this subroutine is ignored.

The character set/font pair is searched for first in the font directory associated with the workstation (if one exists) and then in the nucleus font disk system.

Activation of a character set/font readies it for use by text primitives. Font 1 of the primary character set is always active.

The maximum number of simultaneously active fonts on a workstation is determined by the workstation's font pool size. For more information on available fonts, see *The graPHIGS Programming Interface: Technical Reference (POWER-based System Only)*.

Parameters

wsid — **specified by user, fullword integer**
  Workstation identifier.

csid — **specified by user, fullword integer**
  Character set identifier.

  See Appendix A. ″Character Set and Font Identifiers″ for more information.

font — **specified by user, fullword integer**
  Font number (>=1)

Error Codes

25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
75	TEXT FONT VALUE IS INVALID
542	CHARACTER SET IDENTIFIER IS INVALID
559	FONT POOL SIZE EXCEEDED ON WORKSTATION
563	CHARACTER SET/FONT COMBINATION IS NOT AVAILABLE FOR GEOMETRIC TEXT
647	UNICODE IS NOT SUPPORTED ON THE SPECIFIED WORKSTATION

Related Subroutines

GPDAFO	Deactivate Font
GPLDFO	Load Font

| GPQFO | Inquire Active Fonts |
| GPQFP | Inquire Font Pool Size |

RCP code

201337346 (X'0C002A02')

GPAFDW - Associate Font Directory with Workstation

GPAFDW(*wsid*, *fdid*)

Purpose

Use **GPAFDW** to associate a font directory with a workstation. If there is a font directory associated with the workstation, it is replaced by the new one. Only one font directory can be associated to a workstation at any one time.

Associating a font directory to a workstation allows any character set/font loaded in the directory to be activated to the workstation.

Fonts that reside in the directory take precedence over fonts that exist on the nucleus disk system when they are activated to the workstation.

Parameters

wsid — **specified by user, fullword integer**
    Workstation identifier.

fdid — **specified by user, fullword integer**
    Font directory identifier.

Error Codes

25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
215	SPECIFIED RESOURCES DO NOT EXIST ON THE SAME NUCLEUS
242	SPECIFIED FONT DIRECTORY DOES NOT EXIST

Related Subroutines

GPACFO	Activate Font
GPCRFD	Create Font Directory
GPDAFO	Deactivate Font
GPLDFO	Load Font

RCP code

201337351(X'0C002A07')

GPDAFO - Deactivate Font

GPDAFO (*wsid*, *csid*, *font*)

Purpose

Use **GPDAFO** to deactivate a geometric text font from the specified workstation. If the specified character set/font pair is not active, this subroutine has no effect.

The character set and font can still be active on another workstation.

Deactivating a font from a workstation has no effect on its existence in a font directory (i.e., if a font currently exists in a font directory it will remain in the font directory even though it has been deactivated from the workstation).

Parameters

wsid — **specified by user, fullword integer**
     Workstation identifier.

csid — **specified by user, fullword integer**
     Character set identifier.

     See Appendix A, Character Set and Font Identifiers for more information.

font — **specified by user, fullword integer**
     Font number (>=1)

Error Codes

25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
75	TEXT FONT VALUE IS INVALID
542	CHARACTER SET IDENTIFIER IS INVALID
553	PRIMARY CHARACTER SET FONT ONE CANNOT BE DEACTIVATED

Related Subroutines

GPACFO	Activate Font
GPQFO	Inquire Active Fonts

RCP code

201337347 (X'0C002A03')

GPDLFO - Delete Font

GPDLFO(*fdid,csid,font*)

Purpose

Use **GPDLFO** to delete a font definition from the specified font directory. If the specified font definition does not exist in the font directory, this subroutine has no effect.

If the specified character set/font is currently active to any workstation, it remains active to the workstation until the application deactivates it. However, it is still deleted from the font directory.

Parameters

fdid **— specified by user, fullword integer**
   Font directory identifier.

csid **— specified by user, fullword integer**
   Character set identifier.

   See Appendix A. ″Character Set and Font Identifiers″ for more information.

font **— specified by user, fullword integer**
   Font number (>=1).

Error Codes

75	TEXT FONT VALUE IS INVALID
242	SPECIFIED FONT DIRECTORY DOES NOT EXIST
542	CHARACTER SET IDENTIFIER IS INVALID

Related Subroutines

GPCRFD	Create Font Directory
GPLDFO	Load Font

RCP code

201345282 (X'0C004902')

GPLDFO - Load Font

GPLDFO (*fdid*, *csid*, *font*, *option*)

Purpose

Use **GPLDFO** to load a font definition of a geometric text font to the specified font directory. The specified character set/font pair is taken from a disk accessible by the graPHIGS API shell and sent to the specified font directory in the nucleus. If the specified font definition already exists in the font directory, it is replaced by the new one.

Once a font definition of a geometric text font is loaded in the font directory, and the font directory has been associated to a workstation, the character set/font pair may be activated to a workstation. Font definitions that reside in a font directory take precedence over font definitions that are accessible by the nucleus when they are activated to the workstation. Font directories are primarily intended for networked environments.

Parameters

fdid **— specified by user, fullword integer**
   Font directory identifier.

csid **— specified by user, fullword integer**
   Character set identifier.

   See Appendix A, ″Character Set and Font Identifiers,″ for more information.

font **— specified by user, fullword integer**
   Font number (>=1).

option — **specified by user, fullword integer**

>   Font option (`2=IBM_DEFINED_RANGE`, `3=USER_DEFINED_RANGE`). This parameter specifies what portion of the font definition should be loaded and has its meaning only for the IBM defined double byte character sets. For other character sets, this parameter is ignored.

Error Codes

75   TEXT FONT VALUE IS INVALID

242   SPECIFIED FONT DIRECTORY DOES NOT EXIST

245   FONT OPTION IS INVALID

542   CHARACTER SET IDENTIFIER IS INVALID

Chapter 13. Image Subroutines

This section describes the image subroutines that can be used to manipulate image data. The subroutines discussed in this section allow the following operations:

- Filling a position of an image board by a constant value.
- Moving data between an application's image storage to an image board.
- Defining an image on a workstation for subsequent display.

For each subroutine in this section, each target rectangle must have the same horizontal and vertical size as the source rectangle, and the source rectangle must be entirely within the source image data. See *The graPHIGS Programming Interface: Understanding Concepts (POWER-based System Only)* for more information about source and target rectangles.

GPCAI - Cancel Image

GPCAI (*wsid*, *index*)

Purpose

Use **GPCAI** to cancel an image definition on the specified workstation. If the specified image is used for any image mapping, the image mapping is removed from the view.

If the specified image is not defined, no action is performed.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

index — **specified by user, fullword integer**
Defined image index (>= 1).

Error Codes

25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
288	IMAGE INDEX NOT WITHIN WORKSTATION TABLE RANGE

Related Subroutines

GPCIM2	Create Image Mapping 2
GPCIM3	Create Image Mapping 3
GPDFI	Define Image
GPQIW	Inquire List of Images on the Workstation

RCP code

201346306 (X'0C004D02')

GPDFI - Define Image

GPDFI (*wsid*, *index*, *conn*, *ctid*, *nibid*, *libid*)

Purpose

Use **GPDFI** to define an image on a workstation. Image boards included in the image definition become ready to be displayed on the specified workstation. The specified image boards for the image definition must have been created with the same horizontal and vertical sizes or an error is generated and the image is not defined. If the specified image is already defined, it is canceled and redefined.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

index — **specified by user, fullword integer**
Defined image index (>=1).

conn — **specified by user, fullword integer**
Connection type (-1=FRAME_BUFFER_COMPATIBLE, 1=COMPONENT, 2=INDEXED).

ctid — **specified by user, fullword integer**
Color table identifier. For connection type (*conn*) -1,this parameter is ignored.

nibid — **specified by user, fullword integer**
Number of image boards.

libid — **specified by user, array of fullword integers**
List of image board identifiers. For each of the image connection types, the following number of image boards must be specified:

If*conn*=- 1 (FRAME_BUFFER_COMPATIBLE)
the number of image board identifiers specified in the list equals the number of frame buffer components for the specified workstation.

If*conn*=1 (COMPONENT)
the image board identifiers must be specified in the list.

If*conn*=2 (INDEXED)
1 image board identifier must be specified in the list.

Error Codes

25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
215	SPECIFIED RESOURCES DO NOT EXIST ON THE SAME NUCLEUS
232	SPECIFIED IMAGE BOARD DOES NOT EXIST
284	COLOR TABLE IDENTIFIER DOES NOT EXIST
288	IMAGE INDEX NOT WITHIN WORKSTATION TABLE RANGE
291	SPECIFIED IMAGE CONNECTION TYPE IS NOT SUPPORTED
292	NUMBER OF IMAGE BOARDS DOES NOT MATCH THE CONNECTION TYPE

GPFRCT - Fill Rectangle

> **GPFRCT (*ibid*, *origin*, *size*, *value*)**

Purpose

Use **GPFRCT** to fill a rectangular area in the specified image board with a specific value. The specified fill value's least significant part, corresponding to the image board's bit depth, is used to fill the specified rectangle.

See *The graPHIGS Programming Interface: Understanding Concepts* for a discussion on image processing.

Parameters

ibid **— specified by user, fullword integer**
Image board identifier.

origin **— specified by user, two fullword integers**
Rectangle origin (x, y) (>=0).

size **— specified by user, two fullword integers**
Rectangle size (SX, SY) (>=1).

value **— specified by user, fullword integer**
Fill value.

GPRRCT - Read Rectangle

GPRRCT (*sibid*, *sorigin*, *size*, *format*, *parm*, *torigin*, *data*)

Purpose

Use **GPRRCT** to read pixel data from an image board.

The specified target rectangle need not be inside of the target application image; however, the specified source rectangle must be inside of the source image board. When the target rectangle exceeds the target application image boundaries, pixel data outside the boundaries is discarded. If source and target storage have different bit depth, then source pixels are adjusted to the target bit length by removing most significant bits or adding 0-bit to the most significant part.

See *The graPHIGS Programming Interface: Understanding Concepts* for a discussion on image processing.

Parameters

sibid **— specified by user, fullword integer**
    Source image board identifier.

sorigin **— specified by user, two fullword integers**
    Source rectangle origin (*x*, *y*) (>=0).

size **— specified by user, two fullword integers**
    Rectangle size (*SX*, *SY*) (>=1).

format **— specified by user, fullword integer**
    Application image format 1=PIXEL_ARRAY).

parm **— specified by user, array of fullword quantities**
    Format dependent parameters. The image format 1 requires the following parameters:

    • bit depth — fullword integer 1, 2, 4, 8, or 16

    • *x* size — fullword integer (>=1)

    • *y* size — fullword integer (>=1)

    • pixel order — fullword integer (1=LEFT_RIGHT_BOTTOM_TOP, 2=LEFT_RIGHT_TOP_BOTTOM)

    The product of the bit depth and *x* size must be a multiple of 8. This is to ensure that each row of the application's image data starts on a byte boundary.

torigin **— specified by user, two fullword integers**
    Target rectangle origin (*x*, *y*) (>=0).

data — **returned by the graPHIGS API, array of pixels**
> Target application image data. For the purpose of byte swapping between different shell/nucleus environments, the source application image data with bit depth of 16 will be handled as 16-bit halfwords. For all other bit depths, the application image data will be treated as 8-bit unsigned characters.

Error Codes

None

RCP code

201346316 (X'0C004D0C')

GPTRCT - Transfer Rectangle

GPTRCT (*tibid*, *torigin*, *size*, *sibid*, *sorigin*)

Purpose

Use **GPTRCT** to transfer pixel data from an image board to another image board. Both source and target image boards must reside on the same nucleus.

The specified target rectangle need not be inside of the target image board; however, the specified source rectangle must be inside of the source image board. When the target rectangle exceeds the target image board boundaries, pixel data outside the boundaries is discarded. If source and target storage have different bit depth, source pixels are adjusted to the target bit length by removing most significant bits or adding 0-bit to the most significant part.

Parameters

tibid — **specified by user, fullword integer**
> Target image board identifier.

torigin — **specified by user, two fullword integers**
> Target rectangle origin (x, y) (>=0).

size — **specified by user, two fullword integers**
> Rectangle size (SX, SY) (>=1).

sibid — **specified by user, fullword integer**
> Source image board identifier.

sorigin — **specified by user, two fullword integers**
> Source rectangle origin (x, y) (>=0).

GPTHPO - Three Operand Pixel Operation

GPTHPO (*tibid*, *torigin*, *size*, *sibid1*, *sorigin1*, *sibid2*, *sorigin2*, *op*, *opparm*)

Purpose

Use **GPTHPO** to produce pixel data by combining two pixels on two image boards. The operation performed to the pixel data is specified by an operation type and accompanied operation dependent parameters.

All specified image boards must reside on the same nucleus. The specified target rectangle need not be inside of the target image board; however, two specified source rectangles must be inside of each image board. When the target rectangle exceeds the target image board boundaries, pixel data outside the boundaries is discarded. If source and target storage have different bit depth, source pixels are adjusted to the target bit length by removing most significant bits or adding 0-bit to the most significant part.

Parameters

tibid — **specified by user, fullword integer**
> Target image board identifier.

torigin — **specified by user, two fullword integers**
> Target rectangle origin (x, y) (>=0).

size — **specified by user, two fullword integers**
> Rectangle size (SX, SY) (>=1).

sibid1 — **specified by user, fullword integer**
> First source image board identifier.

sorigin1 — **specified by user, two fullword integers**
> First source rectangle origin (x, y) (>=0).

sibid2 — **specified by user, fullword integer**
> Second source image board identifier.

sorigin2 — **specified by user, two fullword integers**
> Second source rectangle origin (x, y) (>=0).

op — **specified by user, fullword integer**
> Operation type (1=LOGICAL, 2=ARITHMETIC).

opparm — **specified by user, array of fullword quantities**
> Operation-dependent parameters.

> The following operation types are defined and each of them requires specified operation dependent parameters.

1 (`LOGICAL_OPERATION`)

Perform a binary logical operation. This operation requires a fullword integer specifying one of the following logical operations:

- 1: 0
- 2: s1 AND s2
- 3: s1 AND (NOT s2)
- 4: s1
- 5: (NOT s1) AND s2
- 6: s2
- 7: s1 XOR s2
- 8: s1 OR s2
- 9: NOT (s1 OR s2)
- 10: NOT (s1 XOR s2)
- 11: NOT s2
- 12: s1 OR (NOT s2)
- 13: NOT s1
- 14: (NOT s1) OR s2
- 15: NOT (s1 AND s2)
- 16: 1

2 (`ARITHMETIC_OPERATION`)

Performs a binary arithmetic operation. This operation requires a fullword integer specifying one of the following arithmetic operations:

- 1: Add with saturation to $2^{**}n$, where n is a bit depth of the target image board.
- 2: Subtract with saturation to 0
- 3: Minimum of two pixels
- 4: Maximum of two pixels

Error Codes

RCP code

201346315 (X'0C004D0B')

GPTWPO - Two Operand Pixel Operation

GPTWPO (*tibid, torigin, size, sibid, sorigin, op, opparm*)

Purpose

Use **GPTWPO** to transfer pixel data from an image board to another image board through a pixel by pixel operation. The operation performed to the pixel data is specified by an operation type and accompanied operation dependent parameters.

Both source and target image boards must reside on the same nucleus. The specified target rectangle need not be inside of the target image board; however, the specified source rectangle must be inside of the source image board. When the target rectangle exceeds the target image board boundaries, pixel data outside the boundaries is discarded. If source and target storage have different bit depth, source pixels are adjusted to the target bit length by removing most significant bits or adding 0-bit to the most significant part.

Parameters

tibid — **specified by user, fullword integer**
>   Target image board identifier.

torigin — **specified by user, two fullword integers**
>   Target rectangle origin (*x*, *y*) (>=0).

size — **specified by user, two fullword integers**
>   Rectangle size (*SX*, *SY*) (>=1).

sibid — **specified by user, fullword integer**
>   Source image board identifier.

sorigin — **specified by user, two fullword integers**
>   Source rectangle origin (*x*, *y*) (>=0).

op — **specified by user, fullword integer**
>   Operation type (`1=REFLECTION`).

opparm — **specified by user, array of fullword quantities**
>   Operation dependent parameters

>   The following operation is defined and requires operation dependent parameters.

>   **1 (`REFLECTION`)**
>>   Pixels in the source rectangle are placed into the target rectangle in the reverse order. This operation requires a fullword integer specifying an axis about which the pixels are reflected as follows:
>>   - 1: reflect about x-axis (reverse y-direction)
>>   - 2: reflect about y-axis (reverse x-direction)

Error Codes

215   SPECIFIED RESOURCES DO NOT EXIST ON THE SAME NUCLEUS

232   SPECIFIED IMAGE BOARD DOES NOT EXIST

236   RECTANGLE DEFINITION IS INVALID

238   SPECIFIED TWO OPERAND OPERATION IS NOT SUPPORTED

GPWRCT - Write Rectangle

GPWRCT (*tibid*, *torigin*, *size*, *format*, *parm*, *sorigin*, *data*)

Purpose

Use **GPWRCT** to write pixel data into an image board. Pixel data for the specified source rectangle will be extracted from the source application image data and written to the target rectangle within the specified image board.

The specified target rectangle need not be inside of the target image board but the specified source rectangle must be inside of the source application image. When the target rectangle exceeds the target image board boundaries, pixel data outside the boundaries is discarded. If source and target data have different bit depth, source pixels are adjusted to the target bit length by removing most significant bits or adding 0-bit to the most significant part.

See *The graPHIGS Programming Interface: Understanding Concepts* for a discussion on image processing.

Parameters

tibid — **specified by user, fullword integer**
Target image board identifier.

torigin — **specified by user, two fullword integers**
Target rectangle origin (*x*, *y*) (>=0).

size — **specified by user, two fullword integers**
Rectangle size (*SX*, *SY*) (>=1).

format — **specified by user, fullword integer**
Source application image format (1=PIXEL_ARRAY).

parm — **specified by user, variable data**
Format dependent parameters.

The image format 1 requires the following parameters:
- bit depth — fullword integer (1, 2, 4, 8, 16)
- *x* size — fullword integer (>=1)
- *y* size — fullword integer (>=1)
- pixel order — fullword integer (1=LEFT_RIGHT_BOTTOM_TOP, 2=LEFT_RIGHT_TOP_BOTTOM).

  The product of *x* size and bit depth must be a multiple of 8. This is to ensure that each row of the application's image data starts on a byte boundary.

sorigin — **specified by user, two fullword integers**
Source rectangle origin (*x*, *y*) (>=0).

data — **specified by user, array of pixels**
Source application image data. For the purpose of byte swapping between different shell/nucleus environments, the source application image data with bit depth of 16 will be handled as 16-bit halfwords. Bit depths 1, 2, 4, 8 should be packed respectively as 8, 4, 2 and 1 pixels per byte. For all other bit depths, the application image data will be treated as 8-bit unsigned characters.

Error Codes

232   SPECIFIED IMAGE BOARD DOES NOT EXIST

Chapter 14. Utility Subroutines

The subroutines in this category provide convenient mechanisms for modifying data or performing calculations.

Some subroutines perform transformations on matrixes; others let your application alter the viewing characteristics in the Viewing Coordinate (VC) system. In addition, the Pack Data Record utility provides a convenient mechanism for the construction of data records used by input device initialization subroutines.

The Convert Data utility allows you to convert data to a form known by a target application when two or more application processes are communicating.

GPCCV - Convert Coordinate Values

GPCCV (*wsid*, *ctype*, *ptype*, *number*, *ilist*, *errind*, *olist*)

Purpose

Use **GPCCV** to convert coordinate values in a window system from one coordinate system to another. Only workstations which use the facilities of a window system (e.g., X-Windows) support this procedure.

This subroutine converts Normalized Projection Coordinates (NPC), Device Coordinates (DC) or Window Units (WU).

The conversion type (*ctype*) parameter specifies the type of conversion to be performed. The point type (*ptype*) parameter specifies the organization of the input values, either as an array of two-dimensional points (1=POINT_2D) or as an array of three-dimensional points (2=POINT_3D). The *number* parameter specifies the number of two-dimensional or three-dimensional points in the input list (*ilist*) parameter to convert. The array of the output list (*olist*) is the same size as the *ilist*.

This subroutine is assigned escape identifier 1015.

> **Note:** This subroutine is an escape subroutine, and therefore, may not be available on all workstations. Use the Inquire List of Available Escape Subroutines (**GPQES**) to determine if this subroutine is supported by a specified workstation.

Parameters

wsid — **specified by user, fullword integer**
    Workstation identifier.

ctype — **specified by user, fullword integer**
    Conversion type (1=NPC_TO_WU, 2=WU_TO_NPC, 3=DC_TO_WU, 4=WU_TO_DC).

ptype — **specified by user, fullword integer**
    Point type (1=POINT_2D, 2=POINT_3D)

number — **specified by user, fullword integer**
    Number of two-dimensional or three-dimensional points to be converted (>=0).

ilist — **specified by user, array of short floating-point numbers**
    Input list of coordinate values. Depending on the value of the *ptype* parameter, this parameter is treated as an array of two-dimensional or three-dimensional points.

errind — **returned by the graPHIGS API, fullword integer**
    Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of

the following errors exists:

25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
527	ESCAPE FUNCTION NOT AVAILABLE
539	REQUESTED NUMBER < ZERO
624	CONVERSION TYPE IS INVALID
625	POINT TYPE IS INVALID

olist **— returned by the graPHIGS API, array of short floating-point numbers**
Output list of converted coordinate values. This list is the same size as *ilist*.

GPCMT2 - Compose Matrix 2

GPCMT2 (*matra*, *matrb*, *matrix*)

Purpose

Use **GPCMT2** to perform a 3x3 matrix multiplication and return the result.

Transformation Matrix A (*matra*) x Transformation Matrix B (*matrb*) is computed and returned in *matrix*.

For this task, the elements of the transformation matrixes are passed in the following order:

```
|m11 m12 m13|
|m21 m22 m23| ---> (m11,m12,m13,m21....m33)
|m31 m32 m33|
```

Parameters

matra **— specified by user, 9 short floating-point numbers**
Transformation matrix A.

matrb **— specified by user, 9 short floating-point numbers**
Transformation matrix B.

matrix **— returned by the graPHIGS API, 9 short floating-point numbers**
Composed transformation matrix.

GPCMT3 - Compose Matrix 3

GPCMT3 (*matra*, *matrb*, *matrix*)

Purpose

Use **GPCMT3** to perform a 4x4 matrix multiplication and return the results.

Transformation Matrix A (*matra*) x Transformation Matrix B (*matrb*) is computed and returned in *matrix*.

For this task, the elements of the transformation matrixes are passed in the following order:

```
|m11 m12 m13 m14|
|m21 m22 m23 m24|---> (m11,m12,m13,m14,m21,m22,...m44)
|m31 m32 m33 m34|
|m41 m42 m43 m44|
```

Parameters

matra — **specified by user, 16 short floating-point numbers**
    Transformation matrix A.

matrb — **specified by user, 16 short floating-point numbers**
    Transformation matrix B.

matrix — **returned by the graPHIGS API, 16 short floating-point numbers**
    Composed transformation matrix.

GPCVD - Convert Data

GPCVD (*datatype*, *env*, *origin*, *datalen*, *idata*, *odata*)

Purpose

Use **GPCVD** to convert data that is valid in one environment to data that is valid in another environment.

The differences in data in different environments could be:

- character encoding can be EBCDIC or ASCII
- floating-point format can be IBM single precision or IEEE single precision
- the byte order of data can be swapped

You need to convert data when:

- An application process is communicating with another application process and the data the one application process receives from the other application process is not in a form that it recognizes. Likewise, you need to convert data when an application process wants to send data to another application process in a form that the receiving application process recognizes.
- An application is directing workstation-dependent output (WDO) to a workstation existing in a different environment.

When using **GPCVD** for converting communication data between application processes:

- The environment descriptor is the descriptor of the environment of the application process communicating with your application process. Your application process has either received data from or is sending data to that application process. An application process can inquire its environment descriptor by issuing the Inquire Shell Identifier (**GPQSH**) subroutine. An application process can pass its environment descriptor to another application process by issuing the Send Broadcast Message (**GPSBMS**) subroutine or the Send Private Message (**GPSPMS**) subroutine.
- The origin parameter identifies whether the data to be converted originated in your application process doing the conversion (1=LOCAL_DATA) or in the application process you are communicating with (2=EXTERNAL_DATA).

When using **GPCVD** for converting an application's workstation-dependent output (WDO) data to a form recognized by the environment of the workstation to which it is directed:

- The environment descriptor is the descriptor of the environment of the workstation to which the WDO is directed. You can inquire the environment descriptor of the workstation by issuing the Inquire Nucleus Environment (**GPQNCE**) subroutine. Specify a *type* parameter of 2=ENVIRONMENT_DESCRIPTOR and a nucleus identifier (*ncid*) of the nucleus where the workstation was created. If the workstation was opened using the Open Workstation (**GPOPWS**) subroutine, then use a nucleus identifier of one.
- You should set the *origin* parameter to 1=LOCAL_DATA.

The conversion of string data is done using the current text character set defined in the graPHIGS API state list (see the Set Text Character Set [**GPTXCS**] subroutine [page GPTXCS - Set Text Character Set]). The one exception to this is if your application is running locally within the 6090, the graPHIGS API uses the IBM defined character set 1 for the conversion.

Parameters

datatype **— specified by user, fullword integer**

Type of data that is being converted (1=CHARACTER_STRING, 2=FLOATS, 3=INTEGERS, 4=DATA_RECORD).

```
                            ---------------------
        Data Record  0 |  Number of integers|    Fullword integer
           Format            or 0
                            --------------------
                     4 |  Number of floats  |    Fullword integer
                            or 0
                            --------------------
                     8 |  Number of strings |    Fullword integer
                            or 0
                            --------------------
                              Integers
                            --------------------
```

```
                      ┌────────────────────┐
                      │      Floats         │
                      │────────────────────│
                      │      Strings        │
                      └────────────────────┘
```
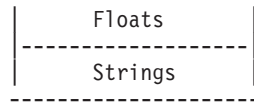

Note: The first byte of a data record string is the length of the string.

env — **specified by user, 4-byte character string**
> Environment descriptor.

origin — **specified by user, fullword integer**
> Origin of the data to be converted (1=`LOCAL_DATA`, 2=`EXTERNAL_DATA`).

datalen — **specified by user, fullword integer (>0)**
> Length in bytes of the data being converted. This also equals the length of the area to return the converted data.

idata — **specified by user, variable data**
> Data to be converted.

odata — **returned by the graPHIGS API, variable data**
> The converted data.

> **Note:** The input area (*idata*) and the output area (*odata*) may be the same area.

GPCVMT - Compute View Matrix

GPCVMT (*matrix*)

Purpose

Use **GPCVMT** to calculate a view matrix based upon the values present in the Utility State List (USL). This view matrix is used as the view matrix parameter on the Set Extended View Representation (**GPXVR**) subroutine.

The matrix returned will perform a change of coordinate system from the World Coordinate (WC) system to a Viewing Coordinate (VC) system in which the origin is the view reference point, the n-axis is the view plane normal, and the v-axis lies in the half plane designated by the View Up vector. This matrix represents the change of coordinate systems by a translation operation followed by a rotation operation.

If the matrix cannot be calculated, the graPHIGS API issues an error.

Parameters

matrix **— returned by the graPHIGS API, 16 short floating-point numbers**
> Transformation matrix.

> The elements are returned in the following order for the transformation matrix:

```
|m11 m12 m13 m14|
|m21 m22 m23 m24|  ---> (m11,m12,m13,m14,m21,...m44)
|m31 m32 m33 m34|
|m41 m42 m43 m44|
```

GPDFCO - Define Coordinate System

GPDFCO (*origin*, *zplane*, *up*, *matrix*)

Purpose

Use **GPDFCO** to compute a three-dimensional, homogeneous transformation matrix.

This matrix mathematically represents a change of coordinates from the default World Coordinate (WC) system to the coordinate system described by the specified input parameters (*origin*, *zplane*, *up*). This matrix represents the change of coordinate systems by a rotation operation followed by a translation operation.

Parameters

origin **— specified by user, 3 short floating-point numbers (WC)**
> Point of origin of new coordinate system.

z **plane — specified by user, 3 short floating-point numbers (WC)**
> *z* plane normal vector of new coordinate system.

up **— specified by user, 3 short floating-point numbers (WC)**
> Up vector of new coordinate system.

matrix — **returned by the graPHIGS API, 16 short floating-point numbers**
> Transformation matrix. The elements are returned in the following order for the transformation matrix:

```
|m11 m12 m13 m14|
|m21 m22 m23 m24|  ---> (m11,m12,m13,m14,m21,m22,...m44)
|m31 m32 m33 m34|
|m41 m42 m43 m44|
```

GPEVM2 - Evaluate View Mapping Matrix 2

GPEVM2 (*window*, *viewpt*, *errind*, *matrix*)

Purpose

Use **GPEVM2** to create a view mapping matrix. The matrix can be used as input to the Set Extended View Representation (**GPXVR**) subroutine. This subroutine returns a two-dimensional matrix.

The calculation of the view mapping matrix is as follows:

- The *z* extents for the viewport are set to the *z* extents of the NPC range.
- The projection type is set to `1=PARALLEL`.
- The projection reference point is placed on a line perpendicular to the center of the specified window. The *z* value of the projection reference point is set to one-half of the maximum of the Umax-Umin and Vmax-Vmin.
- The view plane distance is set to zero.
- The far clipping plane is set to the negative of one-half of the maximum of the Umax-Umin and Vmax-Vmin.
- The near clipping plane is set to one-half of the maximum of the Umax-Umin and Vmax-Vmin.

If the view mapping matrix can be computed, the error indicator is set to zero, and the matrix is returned. If the matrix cannot be computed, the error indicator contains an error number indicating the reason. In this case, the value of the output parameter is unpredictable.

Parameters

window — **specified by user, 4 short floating-point numbers (VC)**
> Window limits (Umin, Umax, Vmin, Vmax)

viewpt — **specified by user, 4 short floating-point numbers (NPC)**
> Viewport limits (Xmin, Xmax, Ymin, Ymax)

errind — **returned by the graPHIGS API, fullword integer**

Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

44 INVALID WINDOW DEFINITION

330 INVALID VIEWPORT

matrix — **returned by the graPHIGS API, 9 short floating-point numbers**

View mapping matrix. For the output view matrix, the elements are in the following order:

```
|m11  m12  m13|
|m21  m22  m23|  --->(m11,m12,m13,m21.....m43)
|m41  m42  m43|
```

Purpose

Use **GPEVM3** to create a view mapping matrix. The matrix can be used as input to the Set Extended View Representation (**GPXVR**) subroutine.

If the view mapping matrix can be computed, the error indicator is set to zero, and the matrix is returned. If the matrix cannot be computed, the error indicator contains an error number indicating the reason. In this case, the value of the output parameter is unpredictable.

Parameters

window — **specified by user, 4 short floating-point numbers (VC)**

Window limits (Umin, Umax, Vmin, Vmax).

viewpt — **specified by user, 6 short floating-point numbers (NPC)**

Viewport limits (Xmin, Xmax, Ymin, Ymax, Zmin, Zmax).

type — **specified by user, fullword integer**

Projection type (1=PARALLEL, 2=PERSPECTIVE).

point — **specified by user, 3 short floating point numbers (VC)**

Projection reference point (*U, V, N*).

dist — **specified by user, short floating-point number (VC)**

Distance of view plane from view reference point along n-axis.

near — **specified by user, short floating-point number (VC)**
> Distance of near plane from view reference point along n-axis.

far — **specified by user, short floating-point number (VC)**
> Distance of far plane from view reference point along n-axis.

errind — **returned by the graPHIGS API, fullword integer**
> If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

44	INVALID WINDOW DEFINITION
55	PRP IS POSITIONED ON THE VIEW PLANE
330	INVALID VIEWPORT

GPPREC - Pack Data Record

GPPREC (*numi, iary, numr, rary, nums, swidth, lens, sary, mlodr, errind, lodr, datarec*)

Purpose

Use **GPPREC** to construct a data record for passing to input device initialization routines. The data record constructed by **GPPREC** consists of a header identifying the number of integers, reals, and character strings in the data record, followed by the actual data. The *lodr* and *datarec* output parameters can be passed to the desired input device initialization subroutine.

GPPREC accepts as input a list of integers, a list of reals, and a list of character strings. The list of character strings is passed in a format similar to a pointlist. That is, a width parameter is specified (*swidth*)

which tells the graPHIGS API how many bytes are placed between the starting location of subsequent character strings. The length of each character string is specified in a separate array of lengths (*lens*).

If the area passed is not large enough to contain the entire data record, the error indicator is set to 509 and no data is placed in the output area.

Parameters

numi — **specified by user, fullword integer**
> Number of integers in the list of integers which follows (>=0).

iary — **specified by user, array of fullword integers**
> Array of integers to be placed in data record.

numr — **specified by user, fullword integer**
> Number of real values in the list of real values which follows (>=0).

rary — **specified by user, array of short floating-point numbers**
> Array of reals to be placed in the data record.

nums — **specified by user, fullword integer**
> Number of strings in the list of strings which follows (>=0).

swidth — **specified by user, fullword integer**
> Width of string array. The number of bytes between subsequent entries in the list of character strings which follows (>=0)

lens — **specified by user, array of fullword integers**
> List of lengths, in bytes, of character strings in the array which follows (>=0).

sary — **specified by user, variable length character string**
> Array of character strings to be placed in the data record. The portion of this array which is used is defined by the *swidth* and *lens* parameters. The *lens* parameter specifies the length of each string in the array and the *swidth* parameter specifies the spacing between subsequent entries in the array of strings.

mlodr — **specified by user, fullword integer**
> Maximum length, in bytes, of data record to be constructed by the graPHIGS API (>=12).
>
> The application provided area for construction of the data record must be large enough to accommodate the data provided. This consists of three fullwords (12 bytes) of header information and one byte length field per string. Therefore, the length of the data record in bytes can be computed using the following formula:
>
> ```
> mlodr >= 12 + (4*numi)
> + (4*numr) + nums +
> (lens(1) + (lens(2) + ... +lens(nums))
> ```

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If zero, the request has been completed. Otherwise, one of the following errors has been encountered:
>
> | | |
> |---|---|
> | **108** | NUMBER OF CHARACTERS IN TEXT STRING < ZERO |
> | **505** | LENGTH OF RETURN ARRAY < ZERO |
> | **506** | NUMBER OF INITIAL VALUES < ZERO |
> | **509** | DATA LENGTH VALUE < ZERO OR REQUIRED LENGTH |
> | **557** | WIDTH PARAMETER < MINIMUM ALLOWED |

lodr — **returned by the graPHIGS API, fullword integer**
> Actual length, in bytes, of data record constructed by the graPHIGS API

datarec — **returned by the graPHIGS API, variable length character string**
> Data record as specified by the input parameters. The returned data record is in the proper format for passing to input device initialization routines.

GPRNBS - Reevaluate Non-Uniform B-Spline Surface

> GPRNBS (*uorder*, *vorder*, *unum*, *vnum*, *uknots*, *vknots*, *tflag*, *utdata*, *vtdata*, *cflags*, *cwidth*, *ctlpts*, *umin*, *umax*, *vmin*, *vmax*, *option*, *nelem*)

Purpose

Use **GPRNBS** to reevaluate a large surface into smaller surfaces. This utilty creates *x* number of structure elements to define all the data and returns the number of structure elements created. If an error occurs, processing stops and the actual number of created structure elements is returned.

The reevaluation of the surface is based on the specified option. If the option is specified as 1=CONTROL_POINTS, then it reevaluates the surface by looking at the number of control points in the *u* and *v* dimension. If the option is specified as 2=ELEMENT_SIZE, then it reevaluates the surface by looking at the size of the surface. If the element size exceeds 64K bytes, the surface is partitioned such that the resulting surfaces will not exceed 64K bytes.

If the option parameter is not a valid value, it defaults to 1=CONTROL_POINTS.

Parameters

uorder — **specified by user, fullword integer**
> Order of the basis functions for the *u* parameter (>=2).

vorder — **specified by user, fullword integer**
> Order of the basis functions for the *v* parameter (>=2).

unum — **specified by user, fullword integer**

Number of surface control points for the *u* direction (>= *uorder*).

vnum — **specified by user, fullword integer**

Number of surface control points for the *v* direction (>= *vorder*).

uknots — **specified by user, array of floating-point numbers**

Knot values for the *u* parameter. The length of this array must be *uorder*+ *unum*. This parameter must be a non-decreasing knot value sequence.

vknots — **specified by user, array of floating-point numbers**

Knot values for the *v* parameter. The length of this array must be *vorder*+ *vnum* This parameter must be a non-decreasing knot value sequence.

tflag — **specified by user, fullword integer**

Surface tessellation quality value flag. This parameter indicates whether the tessellation quality values are specified or not.

Value	Meaning
0	Not specified.
1	Specified.

utdata — **specified by user, array of short floating-point numbers**

Tesselation quality values for the *u* direction. When the *tflag* parameter is 1 (specified), this parameter must contain *unum*- *uorder*+1 quality values. These values are used in conjunction with Surface Approximation Criteria method 8 to control the number of subdivisions made in the *u* direction. The number of subdivisions performed for a patch is approximately: *value of utdata* [default] *u* (the Surface Approximation Criteria control value in the traversal state list).

vdata — **specified by user, array of short floating-point numbers**

Tessellation quality values for the *v* direction. When the *tflag* parameter is 1 (specified), this parameter must contain *vnum*- *vorder*+1 quality values. These values are used in conjunction with Surface Approximation Criteria method 8 to control the number of subdivisions made in the *v* direction. The number of subdivisions performed for a patch is approximately: *value of vtdata* [default] *v* (the Surface Approximation Criteria control value in the traversal state list).

cflags — **specified by user, fullword integer**

Control point option data flags. This parameter indicates what data is specified for each control point. The value specified should be the sum of the following values based on the fields that are specified by the *ctlpts* parameter.

Value	Meaning
0	Control point coordinates.
1	Weights are specified with each control point.This produces the rational form of the Non-Uniform B-Spline Surface.

cwidth — **specified by user, fullword integer**

Number of words between subsequent entries of control points array *ctlpts*.

ctlpts — **specified by user, array of short floating-point numbers**

Grid of control points. The control points are stored by row where a row is considered to be the direction associated with the *u* parameter. For example, the set of control points

```
              ^
              |  m  n  o  p
              |  i  j  k  l
 Increasing v |  e  f  g  h
              |  a  b  c  d
              -------------->
                 Increasing u
```

is stored in the order a, b, c, d, e, f, g, h, i, j, k, l, m, n, o, p. The *cwidth* parameter must be at least 3. If *cflags* specifies that weights are included with each control point, the *cwidth* parameter must be at least 4. Each weight W must be greater than zero when specified.

> **Note:** When W is specified, the control points are not in homogeneous form (i.e., XW, YW, ZW, W). They are specified after division by W or (X,Y,Z,W)

umin — **specified by user, short floating-point number**
The minimum parameter value in the *u* direction at which the surface is evaluated. This value must be greater than or equal to the value of knot *uorder* in the parameter *uknots*.

umax — **specified by user, short floating-point number**
The maximum parameter value in the *u* direction at which the surface is evaluated. This value must be less than or equal to the value of knot *unum*+1 in the parameter *uknots*.

vmin — **specified by user, short floating-point number**
The minimum parameter value in the *v* direction at which the surface is evaluated. This value must be greater than or equal to the value of *vorder* in the parameter *vknots*.

vmax — **specified by user, short floating-point number**
The maximum parameter value in the *v* direction at which the surface is evaluated. This value must be less than or equal to the value of knot *vnum*+1 in the parameter *vknots*.

option — **specified by user, fullword integer**
Option to use when reevaluating the surface (1=CONTROL_POINTS, 2=ELEMENT_SIZE).

nelem — **returned by the graPHIGS API, fullword integer**
The number of structure elements created by the utility or 0 if none were created.

GPROTX - Rotate X

GPROTX (*angle, matrix*)

Purpose

Use **GPROTX** to calculate a rotation matrix around the x-axis using a given angle of rotation.

Parameters

angle — **specified by user, short floating-point number**
    Rotation angle in radians.

matrix — **returned by the graPHIGS API, 16 short floating-point numbers**
    Transformation matrix.

    The elements are returned in the following order for the transformation matrix:

```
|m11 m12 m13 m14|
|m21 m22 m23 m24| ---> (m11,m12,m13,m14,m21,m22,...m44)

GPRTNS - Reevaluate Trimmed Non-Uniform B-Spline Surface

> **GPRTNS (***uorder*, *vorder*, *unum*, *vnum*, *uknots*, *vknots*, *tflag*, *utess*, *vtess*, *cflags*, *cwidth*, *ctlpts*, *ncontour*,
> *ncurve*, *curveinfo*, *tknot*, *ttess*, *cdwidth*, *cddata*, *option*, *nelem***)**

Purpose

Use **GPRTNS** to reevaluate a large trimmed surface into smaller trimmed surfaces. This utilty creates *x*
number of structure elements to define all the data and returns the number of structure elements created.
If an error occurs, processing stops and the actual number of created structure elements is returned.

The reevaluation of the surface is based on the specified option. If the option is specified as
1=`CONTROL_POINTS`, then it reevaluates the surface by looking at the number of control points in the *u* and *v*
dimension. If the option is specified as 2=`ELEMENT_SIZE`, then it reevaluates the surface by looking at the
size of the surface. If either number exceeds 64K bytes, the surface is partitioned such that the resulting
surfaces will not exceed 64K bytes.

If the option parameter is not a valid value, it defaults to 1=`CONTROL_POINTS`.

Parameters

uorder **— specified by user, fullword integer**
 Order of the basis functions for the *u* parameter (>=2).

vorder **— specified by user, fullword integer**
 Order of the basis functions for the *v* parameter (>=2).

unum **— specified by user, fullword integer**
 Number of surface control points for the *u* direction (>= *uorder*).

vnum **— specified by user, fullword integer**
 Number of surface control points for the *v* direction (>= *vorder*).

uknots **— specified by user, array of floating-point numbers**
 Knot values for the *u* parameter. The length of this array must be *uorder*+ *unum*. This parameter
 must be a non-decreasing knot value sequence.

vknots — **specified by user, array of floating-point numbers**

Knot values for the *v* parameter. The length of this array must be *vorder*+ *vnum*. This parameter must be a non-decreasing knot value sequence.

tflag — **specified by user, fullword integer**

Surface tessellation quality value flag. This parameter indicates whether the tessellation quality values are specified or not.

Value	Meaning
0	Not specified.
1	Specified.

utess — **specified by user, array of short floating-point numbers**

Tesselation quality values for the *u* direction. When the *tflag* parameter is 1 (specified), this parameter must contain *unum*- *uorder*+1 quality values. These values are used in conjunction with Surface Approximation Criteria method 8 to control the number of subdivisions made in the *u* direction. The number of subdivisions performed for a patch is approximately: *value of utess* [default] *u* (the Surface Approximation Criteria control value in the traversal state list).

vtess — **specified by user, array of short floating-point numbers**

Tessellation quality values for the *v* direction. When the *tflag* parameter is 1 (specified), this parameter must contain *vnum*- *vorder*+1 quality values. These values are used in conjunction with Surface Approximation Criteria method 8 to control the number of subdivisions made in the *v* direction. The number of subdivisions performed for a patch is approximately: *value of vtess* [default] *v* (the Surface Approximation Criteria control value in the traversal state list).

cflags — **specified by user, fullword integer**

Control point option data flags. This parameter indicates what data is specified for each control point. The value specified should be the sum of the following values based on the fields that are specified by the *ctlpts* parameter.

Value	Meaning
0	Control point coordinates.
1	Weights are specified with each control point. This produces the rational form of the Non-Uniform B-Spline Surface.

cwidth — **specified by user, fullword integer**

Number of words between subsequent entries of control points array *ctlpts*.

ctlpts — **specified by user, array of short floating-point numbers**

Grid of control points. The control points are stored by row where a row is considered to be the direction associated with the *u* parameter. For example, the set of control points

```
             ^
             |  m  n  o  p
             |  i  j  k  l
Increasing v |  e  f  g  h
             |  a  b  c  d
             -------------->
             Increasing u
```

is stored in the order a, b, c, d, e, f, g, h, i, j, k, l, m, n, o, p. The *cwidth* parameter must be at least 3. If *cflags* specifies that weights are included with each control point, the *cwidth* parameter must be at least 4. Each weight W must be greater than zero when specified.

Note: When W is specified, the control points are not in homogeneous form (i.e., XW, YW, ZW, W). They are specified after division by W or (X,Y,Z,W).

ncontour — **specified by user, fullword integer**

Number of contours to be generated (>=0).

ncurve **— specified by user, fullword integer**

> Number of curves in each contour. Each entry must be greater than or equal to 1. The length of this array is defined by the value of *ncontour* parameters.

curveinfo **— specified by user, array of 6 fullword data**

> Array containing information about each curve. Each entry of this parameter must have the following fields in this order:

> **type of curve**
>> — fullword integer

>> This parameter specifies various options of the curve. Each option is specified by a bit in this word and the following bits are currently defined:

Bit	Meaning
0-28	Reserved. Must be set at 0.
29	Tessellation quality flag. If set, a tessellation quality value for each span of this curve is specified in the *ttess* parametr.
30	Weight flag. If set, the curve is rational and the weight is specified for each control point in the *cddata* parameter.
31	Boundary flag. If set, the curve is treated as an edge of the composite fill area.

> **order** — fullword integer

>> Order of the curve (>=2)

> **number of data**
>> — fullword integer

>> Number of entries of the *cddata* parameter used to define the curve. This parameter corresponds to the *npoint* parameter of the Non-Uniform B-Spline Curve 2. The specified entries of numbers of the *cddata* parameter are used as its *ctlpts* parameter.

> **start** — short floating-point number

>> The parameter value representing the start point of the curve.

> **end** — short floating-point number

>> The parameter value representing the end point of the curve.

tknot **— specified by user, array of short floating-point numbers**

> Array of knot values for the *t* direction of the curve. The sequence of each list in this array is assumed to match the order of the curve definitions in *curveinfo*. The length of each list is equal to the *order+ number of data* for the curve.

ttess **— specified by user, array of short floating-point numbers**

> Array of tessellation quality values. This array must contain one list of each Non-Uniform B-Spline Curve with a tessellation quality flag set to ON. For other curves, this array is not referenced. The sequence of each list in this array is assumed to match the order of the curve definitions in *curveinfo* The length of each list is equal to the *number of data- order*+1 of the curve.

cdwidth **— specified by user, fullword integer**

> Specifies the number of fullwords between each entry of the array in *cddata* If there is any rational curve in the *curveinfo* parameter, this parameter must be at least 3. Otherwise, it must be larger than or equal to 2.

cddata **— specified by user, array of short floating-point numbers**

> This array must contain one list for each curve. The sequence of each list in this array is assumed to match the order of the curve definitions in *curveinfo*. The length of each list is equal to the number of definition data specified by the *curveinfo* parameter.

For each entry, the following fields are defined and the fields must be specified in this order without any gap.

u, v components
— two short floating-point numbers

weight
— short floating-point number

option **— specified by user, fullword integer**
Option to use when reevaluating the surface (`1=CONTROL_POINTS, 2=ELEMENT_SIZE`).

nelem **— returned by the graPHIGS API, fullword integer**
The number of structure elements created by the utility, or zero if none were created.

Chapter 15. Error Handling Subroutines

The subroutines in this category allow your application to modify the error handling characteristics of the graPHIGS API system. By default, the error handler provided by the graPHIGS API is given control when an error is detected. However, the application can provide an alternative error handler which supersedes the default and receives control when an error is detected.

If desired, the Set Error Handling Mode (**GPEMO**) subroutine can be used to set error handling `1=0FF`. When error handling is `1=0FF`, processing continues until an ABEND condition is reached. Generally, error handling should remain `2=0N` in a program development environment. Error handling is `2=0N` by default.

See *The graPHIGS Programming Interface: Understanding Concepts* for details on error handlers and their operation.

See *The graPHIGS Programming Interface: Writing Applications* for information on the techniques used to code application error handlers in specific languages.

See *The graPHIGS Programming Interface: Messages and Codes* for information on specific error conditions and system responses - severity levels, etc.

GPEHND - Define Error Handling Subroutine

GPEHND (*error-handler*)

Purpose

Use **GPEHND** to specify the address of an application-defined first-level error handling routine.

The graPHIGS API gives control to this routine when an error is detected. If an application error handler is not defined, the graPHIGS API uses the default, which logs an error in the file specified by the first parameter of the Open graPHIGS (**GPOPPH**) subroutine. A first-level error handler can only invoke Inquiry subroutines and the Error Logging (**GPELOG**) subroutine.

The application error handler receives six parameters, when invoked.

number — **returned by the graPHIGS API, fullword integer**
> Error number.

name — **returned by the graPHIGS API, 8-byte character string**
> Identification of the graPHIGS API procedure causing the error.

file — **returned by the graPHIGS API, 8-byte character string**
> Error file identifier.

wsid — **returned by the graPHIGS API, fullword integer**
> Workstation identifier associated with the error.

flag — **returned by the graPHIGS API, fullword integer**

Bits 0-29	Reserved.
Bit 30	Specifies if the error was generated by a subroutine performed at a specific workstation. If set, the *wsid* parameter contains the workstation identifier. Otherwise the *wsid* parameter is not valid.
Bit 31	If set, it indicates that there are more errors waiting for the current graPHIGS API subroutine.

severity — **set by error handler, fullword integer**
> Error severity (initialized to zero by the graPHIGS API).

Parameters

error-handler — **specified by user, fullword integer**
> The address of the routine receiving control when an error is encountered.

> The default error handler can be reset by specifying an error handler address of a fullword binary zero.

> A user supplied error handler receives the parameter list shown above *only* if the application is using the non-reentrant interface. If it is using the reentrant interface, the error handler receives the Application Anchor Block (AAB) as its first parameter, followed by the other parameters. If the application is using the System Programmer's Interface (SPI), it receives the following data: the AAB; a Request Control Parameter code (RCP), which it should ignore *and must not corrupt* (this code provides the only way to return to the program once error processing is completed[default] and the remaining parameters. The error handler has one special consideration. It is possible for an application to mix SPI and re-entrant subroutines. If it does, the error handler receives varying length parameter lists. The type of list passed by the application depends on the type of the current graPHIGS API subroutine. The only way the error handler can differentiate between interfaces is by checking the number of parameters and by searching for the End of List marker. See *The graPHIGS Programming Interface: Writing Applications*.

> In effect, mixing the two types of interface subroutines is practical only if the language in which the error handler is written allows the number of parameters to be determined.

GPELOG (*file*)

Purpose

Use **GPELOG** to print an error message to the specified error file. When invoked, the error which caused the first-level error handler to be called is logged to the specified file. If the specified file is blank or cannot be opened, then the error is logged to the console from which the application was started.

This subroutine is available only to a first-level error handler.

Parameters

file — **specified by user, 8-byte character string**
      Error file identification.

Error Codes

521   NOT IN ERROR STATE

Related Subroutines

GPEHND   Define Error Handling Subroutine

RCP code

201337858 (X'0C002C02')

GPEMO - Set Error Handling Mode

GPEMO (*mode*)

Purpose

Use **GPEMO** to enable or disable graPHIGS API error handling.

The error handling mode in the Error State List (ESL) is set to the value specified. If the error handling mode is `1=OFF`, then the errors detected by the graPHIGS API are ignored. The default error handling mode is `2=ON`.

Parameters

mode — **specified by user, fullword integer**
      Error handling mode (`1=OFF`, `2=ON`).

Error Codes

94   ERROR HANDLING MODE IS INVALID

Related Subroutines

GPQEMO   Inquire Error Handling Mode

RCP code

201337860 (X'0C002C04')

GPEXIT - Specify an Error Exit and Error Threshold

GPEXIT (*error-routine*, *severity*)

Purpose

Use **GPEXIT** to specify a second-level error handler to receive control at the end of a graPHIGS API subroutine call if an error of at least the specified severity is encountered.

The severity of an error can be assigned by the first-level error handler (see Define Error Handling [**GPEHND**] [page GPEHND - Define Error Handling Subroutine]) subroutine, which receives control before the second-level error handler.

If a value of zero or less is specified for the *severity* parameter of this subroutine, the error exit is invoked after every call to the graPHIGS API If a severity level of 17 or more is specified, the error exit is never invoked.

When the error severity threshold is zero, your second-level error exit routine should perform the following steps to prevent infinite loops:

1. Set the error severity threshold to 17 using **GPEXIT** to prevent the graPHIGS API from calling your second-level error exit.
2. Call any graPHIGS API subroutine. Note that because the severity threshold is 17, your second-level error exit will not be called again.
3. Reset the error severity threshold to zero before returning control to the graPHIGS API. Note that the graPHIGS API will not transfer control to your second-level error exit after a call to **GPEXIT.**

The default error exit can be reset by specifying an error exit address consisting of a fullword binary zero.

Control is returned to the application statement following the one which invoked the graPHIGS API A second-level error handler can call any graPHIGS API subroutine except the Error Logging (**GPELOG**) subroutine.

Parameters

error-routine **— specified by user, fullword integer**
> The address of the routine receiving control when an error of the specified severity or greater is encountered.

severity **— specified by user, fullword integer**
> A fullword integer indicating the minimum level of severity (severity threshold) at which the error routine is called.

Error Codes

Chapter 16. Miscellaneous Subroutines

This section contains the definition of two miscellaneous subroutines. The first is an escape routine used by the graPHIGS API for special functions such as setting plot sizes. The second subroutine is used to read the contents of a workstation's frame buffer.

GPES - Escape

GPES (*funcid, lidr, idr, mlodr, lodr, odr*)

Purpose

Use **GPES** to perform an escape function. The specific escape subroutine is identified by way of the identifier parameter. In general, an escape subroutine accepts both an input data record and an output data record to place any output generated by the escape subroutine.

If the specified escape identifier is not supported by the graPHIGS API, then the subroutine may be ignored or produce unexpected results.

Parameters

funcid — **specified by user, fullword integer**
Identifier of the escape to be performed.

1001 - Sound Alarm: This escape subroutine causes the specified workstation to sound its alarm. If the workstation does not have an alarm or does not support this escape subroutine, then the escape is ignored. The input data record for this escape code contains the workstation identifier at which to perform this function. There is no output data record generated by this function.

1002 - Enable/Disable Link Switch Notification: When the link switch is modified on a 5080 workstation, this escape subroutine enables or disables the generation of events. The 5080 operator has the capability to switch between a RT PC and a System/370. This escape subroutine may be used to enable application notification of this operator action. Notification is disabled by default. Notification occurs by way of the graPHIGS API event queue. When the switch is changed, an event is placed on the event queue. The event type identifies the direction of the switch. Event type 101 indicates that the 5085 link has been switched away from the application program. Event type 102 indicates that the 5085 link has been switched to the application program. The input data record for this escape code contains the workstation identifier at which to perform this function and a flag which indicates whether this capability is being enabled or disabled. This escape subroutine is only valid for 5080 workstations. When specified with a workstation type other than a 5080, this escape is ignored. There is no output data record generated by this function.

1003 - GDF/CGM Plot Size: This escape subroutine allows the user to specify the width of the plotted output in meters. Zero and negative sizes are not valid. The input data record for this escape code contains the identifier for the workstation at which to perform this function and the value, in floating-point representation, for the size. This escape subroutine is only valid for workstations of type 'GDF' or 'CGM'. When specified with a workstation type other than 'GDF' or 'CGM', this escape is ignored. No output data record is generated by this function.

CGM plot scaling is implemented by adjusting the scale factor metric to be equal to 960 * plot size/1000. This is the distance that corresponds to one Virtual device coordinate (VDC) unit. When you change the plot size, values stored in the workstation description table are not changed to reflect the new display size. The nominal line width, nominal edge width, and marker size are not scaled.

425

GDF scaling is accomplished via a comment order which is understood by the IBM GDF interpreters which are supplied by the graPHIGS API program product. Other interpreters will most likely ignore this information but will not generate an error. If you are designing your own interpreter and you wish to utilize the scaling comment order, note that it consists of the following 18 bytes. (For more detailed information, see the *GDDM Base Programming Reference, Volume 2*).

Field Length	Content	Meaning
1	X'01'	Comment order.
1	X'10'	Length of following data.
2	0000	Reserved.
8	'graPHIGS'	Application identifier (*char* data).
1	X'01'	Indicates exact scale comment.
1	X'04'	Length of following data.
4	4 byte floating-point	Size in meters of the *x* dimension of the resulting GDF plot.

1009 - Window Resize Notification Control: This escape subroutine allows your application to be notified when the window containing a mapped display surface changes size. This escape subroutine also allows your application to specify whether it wants the graPHIGS API to redraw the contents of the window when the window is resized. This escape subroutine is meaningful only on a workstation which uses the facilities of a window system (e.g., X Windows).

The mapped display surface is the subarea of the window that the workstation uses as the workstation's display surface for graphical output and input. The mapped display surface size may change if the user changes the size of the window that contains the mapped display surface. Your application can receive notification of such size changes by enabling this Window Resize Notification function. Notification occurs by way of the graPHIGS API event queue. The new size of the mapped display surface can then be obtained using the Inquire Mapped Display Surface Size (**GPQMDS**) subroutine. By default, notification is disabled and the window contents will always be redrawn when a resize occurs. The input data record for this escape code contains the workstation identifier at which to perform this function. There is no output data record generated by this function.

1011 - Window Exposure Notification Control: This escape subroutine allows your application to be notified when the window containing a mapped display surface is exposed. This escape subroutine also allows your application to specify whether it wants the graPHIGS API to redraw the contents of the screen when the exposure occurs. This escape subroutine is meaningful only on a workstation which uses the facilities of a window system (e.g., X Window System).

Your application can receive notification each time the window is exposed by enabling this Window Exposure Notification function. Notification occurs by way of the graPHIGS API event queue. By default, notification is disabled and redraw will occur. This function causes generation of event class 106 (Window Exposure Event), retrieved by the Get Window (**GPGWIN**) subroutine. The input data record for this subroutine code contains the workstation identifier at which to perform this function. There is no output data record generated by this function.

1012 - Window Deletion Notification Control: This escape subroutine allows your application to be notified when the window is deleted (closed) via the Window Manager. (See *The graPHIGS Programming Interface: Technical Reference* for more details on this function).

1014 - Workstation-Dependent Output: This escape subroutine allows your application to generate workstation-dependent output. The graPHIGS API can send this data directly to the

workstation. This escape subroutine is valid only for workstations of type 'CGM'. When specified with a workstation type other than 'CGM', this escape is ignored.

The input data record contains the workstation identifier, which specifies where the graPHIGS API performs the subroutine, and the output data, which is *not* verified by the workstation. The graPHIGS API does *not* guarantee the validity of the data. It is the application's responsibility to ensure that the data is valid (e.g., proper length(s), identifiers, padding, etc.). When character encoding, floating-point, and/or byte ordering differences exist between the target workstation and the application environment, the application must ensure the validity of this data also. For information on how the application can ensure the validity of this data, see the Convert Data (**GPCVD**) subroutine. For information on CGM data, see the "CGM Workstation" in *The graPHIGS Programming Interface: Technical Reference*. There is no output data record generated by this function.

lidr — **specified by user, fullword integer**
>   Length of the input data record in bytes (0<=*lidr*<=32K).

idr — **specified by user, variable length character string**
>   Input data record. Escape subroutine identifier 1001 (sound alarm) requires the following input data record:

```
    ---------------------------
   |            1              |   number of integers   (fullword integer)
   |---------------------------|
   |            0              |   number of reals      (fullword integer)
   |---------------------------|
   |            0              |   number of strings    (fullword integer)
   |---------------------------|
   |   workstation identifier  |                        (fullword integer)
    ---------------------------
```

Escape subroutine identifier 1002 (link switch notification) requires the following data record:

```
      ---------------------------
  0  |            2              |   number of integers   (fullword integer)
     |---------------------------|
  4  |            0              |   number of reals      (fullword integer)
     |---------------------------|
  8  |            0              |   number of strings    (fullword integer)
     |---------------------------|
 12  |   workstation identifier  |                        (fullword integer)
     |---------------------------|
 16  |    disable/enable flag    |   1=DISABLE, 2=ENABLE  (fullword integer)
      ---------------------------
```

Escape subroutine identifier 1003 (GDF/CGM plot size) requires the following data record:

```
      ---------------------------
  0  |            1              |   number of integers   (fullword integer)
     |---------------------------|
  4  |            1              |   number of reals      (fullword integer)
     |---------------------------|
  8  |            0              |   number of strings    (fullword integer)
     |---------------------------|
 12  |   workstation identifier  |                        (fullword integer)
     |---------------------------|
 16  |     plot size value       |                        (real)
      ---------------------------
```

Escape subroutine identifier 1009 (Window Resize Notification Control) requires the following data record:

```
      ---------------------------
  0  |            3              |   number of integers   (fullword integer)
     |---------------------------|
```

```
 4   |           0            | number of reals     (fullword integer)
     |-------------------------|
 8   |           0            | number of strings   (fullword integer)
     |-------------------------|
12   |  workstation identifier |                     (fullword integer)
     |-------------------------|
     |    disable/enable flag  | 1=DISABLE, 2=ENABLE (fullword integer)
     |-------------------------|
20   |    redraw indicator     | 1=REDRAW, 2=NO_DRAW (fullword integer)
     -------------------------
```

Escape subroutine identifier 1011 (Window Exposure Notification Control) requires the following data record:

```
     -------------------------
 0   |           3            | number of integers  (fullword integer)
     |-----------------------|
 4   |           0            | number of reals     (fullword integer)
     |-----------------------|
 8   |           0            | number of strings   (fullword integer)
     |-----------------------|
12   |  workstation identifier |                     (fullword integer)
     |-----------------------|
16   |   disable/enable flag   | 1=DISABLE, 2=ENABLE (fullword integer)
     |-----------------------|
20   |    redraw indicator     | 1=REDRAW, 2=NO_DRAW (fullword integer)
     -------------------------
```

Escape subroutine identifier 1012 (Window Deletion Notification Control) requires the following data record:

```
     -------------------------
 0   |           2            | number of integers  (fullword integer)
     |-----------------------|
 4   |           0            | number of reals     (fullword integer)
     |-----------------------|
 8   |           0            | number of strings   (fullword integer)
     |-----------------------|
12   |  workstation identifier |                     (fullword integer)
     |-----------------------|
16   |   disable/enable flag   | 1=DISABLE, 2=ENABLE (fullword integer)
     -------------------------
```

Escape subroutine identifier 1014 (Workstation-Dependent Output) requires the following data record:

```
     -------------------------
 0   |           1            | number of integers  (fullword integer)
     |-------------------------|
 4   |           0            | number of reals     (fullword integer)
     |-------------------------|
 8   |           1            | number of strings   (fullword integer)
     |-------------------------|
12   |  workstation identifier |                     (fullword integer)
     |-------------------------|
16-n |           data          |                     (byte string)
     -------------------------
```

mlodr — **specified by user, fullword integer**
> Maximum length of the output data record to be returned by the graPHIGS API in bytes.

lodr — **returned by the graPHIGS API, fullword integer**
> Length of the output data record returned by the graPHIGS API in bytes.

odr — **returned by the graPHIGS API, variable length character string**
> Output data record.

GPRDFB - Read Frame Buffer

GPRDFB (*wsid*, *frame*, *sorigin*, *size*, *format*, *parm*, *torigin*, *data*)

Purpose

Use **GPRDFB** to read pixel data from one of the workstation's frame buffer components into your target application image data. The specified bit depth of your target application image data must match the bit depth of the workstation's frame buffer component that contains the pixel data.

Use the Inquire Frame Buffer Characteristics (**GPQFBC**) inquiry subroutine to determine your workstation's frame buffer characteristics, in particular the bit depth of the workstation's frame buffer components.

The specified target rectangle need not be inside the target application image, but any portion of the target rectangle outside the image will be clipped. The pixel data returned is workstation dependent when all or part of the source rectangle is not visible. It is the application's responsibility to serialize access to the workstation during the read frame buffer operation. This means that other application processes should not attempt to modify the workstation while the read frame buffer is being performed. To guarantee the state of the frame buffer that is returned by this subroutine call (i.e., to ensure that all pending updates are in the returned data), the application should issue an Update Workstation (**GPUPWS**) subroutine before issuing this function.

This subroutine is assigned escape identifier 1007.

> **Note:** This subroutine is an escape subroutine and therefore may not be available on all workstations. Use the Inquire List of Available Escape Subroutines (**GPQES**) subroutine to determine if this subroutine is supported by an open workstation. If not supported, an error will be generated.

Parameters

wsid — **specified by user, fullword integer**
    Workstation identifier.

frame — **specified by user, fullword integer**
    Frame buffer component number. This parameter must be a valid frame buffer component of the workstation.

sorigin — **specified by user, two fullword integers**
    Source rectangle origin (*x*, *y*) (>=0).

size — **specified by user, two fullword integers**
    Rectangle size (*SX*, *SY*) (>=1).

format — **specified by user, fullword integer**
    Application image format (1=`PIXEL_ARRAY`).

parm — **specified by user, variable data**
    Format dependent parameters. The image format 1 requires the following parameters:

- bit depth — fullword integer (1, 2, 4, 8, or 16). This bit depth must match the frame buffer component bit depth.
- *x* size — fullword integer (>=1)
- *y* size — fullword integer (>=1)
- pixel order — fullword integer (1=`LEFT_RIGHT_BOTTOM_TOP`, 2=`LEFT_RIGHT_TOP_BOTTOM`)

    The product of the *x* size and the bit depth must to a multiple of 8. This is to ensure that each row of the application's image data starts on a byte boundary.

torigin — **specified by user, two fullword integers**
> Target rectangle origin (*x*, *y*) (>=0).

data — **returned by the graPHIGS API, array of pixels**
> Target application image data. The graPHIGS API returns the pixels within the intersection of the target application image data and the target rectangle.

> The target application image data with bit depth of 16 will be handled as 16-bit halfwords. For all other bit depths, the application image data will be treated as 8-bit unsigned characters.

Chapter 17. Inquire Subroutines

Inquiry programming subroutines allow application programs to obtain the following information:

- Default system characteristics
- Current state of the system
- Default workstation characteristics
- Current state of a workstation
- Configuration of a workstation
- Structure existence and relationships
- Structure content
- Nucleus characteristics
- Error state and message content

For all inquire subroutines, the parameters listed *prior to* the *errind* parameter are specified by the user; *errind* and the parameters which follow are returned by the graPHIGS API.

WSL Inquiries

The subroutines in this section have a first parameter of workstation identifier (*wsid*). These subroutines inquire information from the Workstation State List (WSL) corresponding to the specified workstation identifier. The WSL contains the current state of the workstation. To inquire the general characteristics and capabilities of the workstation type, see ″WDT Inquiries.″

WDT Inquiries

Subroutines with a first parameter of workstation type (*wstype*) inquire information from the Workstation Description Table (WDT) corresponding to the specified workstation type. For each workstation you may inquire information from its generic or actual descriptor table. The generic descriptor table contains the maximum capabilities of the workstation, whereas the actual descriptor table contains the realized capabilities of the workstation after it is opened. To be able to inquire the realized capabilities of a workstation, you must supply the realized workstation type on the inquiry. Use the Inquire Realized Connection and Type (**GPQRCT**) subroutine to obtain the realized workstation type.

NSL Inquiries

The subroutines in this section inquire information from the Nucleus State List (NSL).

The NSL contains the dynamic (variable) states of the nucleus connected to the graPHIGS API shell.

GPQNCS
> Inquire Available Nucleus Storage Size.

SSL Inquiries

The subroutines in this section inquire information from the Structure State List (SSL) about the state of the structure store that exists in the nucleus connected to the graPHIGS API shell.

The following information can be inquired:
- current structure element pointers
- the currently open structure
- if a structure is in the SSL
- all the structures in the SSL
- structures executed by a structure
- the structure elements in a structure
- contents of a structure element
- workstations associated with a structure
- list of structures that conflict between different structure stores
- ancestor/descendant path data

GPELS

GPQSTI

        Inquire Structure Identifiers.

GPQSTS

        Inquire Structure Status.

GPQWSA

        Inquire Set of Workstations to Which Associated.

Archive Inquiries

The subroutines in this section inquire archive information from the structure store and the archive files.

With these subroutines, you can retrive the following information:
- list of structures in the archive file
- list of structures that conflict between the specified archive file and the currently selected structure store
- list of open archive files
- the conflict resolution flags
- ancestor/descendant path data

GPQACA

        Inquire All Conflicting Structures in Archive.

GPQARF

        Inquire Archive Files.

GPQCNA

        Inquire Conflicting Structures in Network in Archive.

GPQCNR

GPRSTI
> Retrieve Structure Identifiers.

GPELS - Element Search

> GPELS (*strid*, *start*, *direction*, *inclnum*, *lincl*, *exclnum*, *lexcl*, *errind*, *status*, *position*, *header*)

> **Note:** This subroutine is a Structure State List (SSL) inquiry. For an overview, see ″SSL Inquiries.″

Purpose

Use **GPELS** to search through a specified structure for an element that matches a given criteria. The search starts at a specified element position and searches in a designated direction until either an element is found that matches the criteria or until the limits of the structure are reached.

Search criteria
> An element is selected if the element code is in the element inclusion list and not in the element exclusion list.

Element exclusion
> An element is excluded if the element code is either not in the inclusion list or it is in the exclusion list.

Starting search position
> The search starts at element position of zero if the specified starting position is less than zero. The search starts with the last element in the structure, if the specified starting position is larger than the number of elements in the structure.

> If the search is successful, the application sets the status indicator to `2=SUCCESS`, the element position is returned in the *position* parameter, and the element type and size is returned in the *header* parameter. Otherwise, the application sets the status indicator to `1=FAILURE` and the values returned in the *position* and *header* parameters are unpredictable.

> If the information is available, the error indicator is set to zero and the values are put into the output parameters. If the information is unavailable, the error indicator contains an error number indicating the reason. In this case, the values returned in the output parameters are unpredictable.

> For the valid structure element codes used by the graPHIGS API see *The graPHIGS Programming Interface: Technical Reference*. You can use the following two additional element codes in the inclusion and exclusion lists for this subroutine:

Decimal	Hex	Description
0	0000	Represents element position zero.
65535	FFFF	Represents all elements.

Parameters

strid — **specified by user, fullword integer**
> Structure identifier.

start — **specified by user, fullword integer**
> The position of the element to begin the search.

direction — **specified by user, fullword integer**

> Search direction(1=BACKWARD, 2=FORWARD)

inclnum — **specified by user, fullword integer**

> The number of element codes in the inclusion list (>=0)

lincl — **specified by user, array of fullword integers**

> A list of element codes to be included in the inclusion list.

exclnum — **specified by user, fullword integer**

> The number of element codes in the exclusion list (>=0)

lexcl — **specified by user, array of fullword integers**

> A list of element codes to be included in the exclusion list.

errind — **specified by user, fullword integer**

> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:
>
> **12**   FUNCTION REQUIRES STATE SSSL.
>
> **122**   STRUCTURE IDENTIFIER DOES NOT EXIST.
>
> **528**   DIRECTION VALUE IS INVALID.
>
> **529**   NUMBER OF ENTRIES IN INCLUSION OR EXCLUSION LIST < ZERO.

status — **returned by the graPHIGS API, fullword integer**

> Status indicator which indicates the results of the search (1=FAILURE, 2=SUCCESS)

position — **returned by the graPHIGS API, fullword integer**

> Position of the element found in the search.

header — **returned by the graPHIGS API, fullword integer**

> Element header of the element found in the search. The first halfword contains the length of the element and the second halfword contains the element code. The information that corresponds to each element header and the list of valid structure element codes used by graPHIGS API are found in *The graPHIGS Programming Interface: Technical Reference*.

GPQAAF - Inquire Advanced Attribute Facilities

GPQAAF (*wstype*, *attrib*, *start*, *number*, *errind*, *totnum*, *enum*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQAAF** to inquire the list of enumerations of an attribute that are supported by a specific workstation.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
> Workstation type.

attrid — **specified by user, fullword integer**
> Attribute identifier being inquired (1=EDGE_FLAG, 2=FACE_DISTINGUISH_MODE, 3=LIGHTING_CALCULATION_MODE, 4=POLYGON_CULLING, 5=POLYHEDRON_EDGE_CULLING, 6=POLYLINE_END_TYPE, 8=INTERIOR_SHADING_METHODS, 10=REFLECTANCE_MODES).

start — **specified by user, fullword integer**
> Starting member of the list of supported enumerations for the specified attribute (>=1).

number — **specified by user, fullword integer**
> Number of supported enumerations requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> | | |
> |---|---|
> | **23** | SPECIFIED WORKSTATION TYPE DOES NOT EXIST |
> | **35** | WORKSTATION HAS ONLY INPUT CAPABILITIES |
> | **314** | AN ATTRIBUTE IDENTIFIER IS INVALID |
> | **538** | START VALUE < ONE |
> | **539** | REQUESTED NUMBER < ZERO |
> | **543** | START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED |
> | **548** | SPECIFIED WORKSTATION TYPE CANNOT BE LOADED |

totnum — **returned by the graPHIGS API, fullword integer**
> Total number of supported enumerations for the specified attribute.

enum — **returned by the graPHIGS API, array of fullword integers**
> List of supported enumerations for the specified attribute.
> * 1 - Edge Flag (1=OFF, 2=ON, 3=GEOMETRY_ONLY)

- 2 - Face Distinguish Mode (`1=NONE, 2=COLOR_SURFACE_PROPERTIES`)
- 3 - Lighting Calculation Mode (`1=NONE, 2=PER_AREA, 3=PER_VERTEX`)
- 4 - Polygon Culling (`1=NONE, 2=BACK, 3=FRONT`)
- 5 - Polyhedron Edge Culling (`1=NONE, 2=BOTH_BACK, 3=BOTH_FRONT, 4=BOTH_BACK_BOTH_FRONT, 5=BACK_AND_FRONT, 6=LEAST_ONE_BACK, 7=LEAST_ONE_FRONT`)
- 6 - Polyline End Type (`1=FLAT, 2=ROUND, 3=SQUARE`)
- 8 - Interior Shading Methods (`1=SHADING_NONE, 2=SHADING_COLOR, 3=SHADING_DATA`)

GPQACA - Inquire All Conflicting Structures in Archive

GPQACA (*arid*, *start*, *number*, *errind*, *totnum*, *idstrid*)

Note: This subroutine is an Archive inquiry. For an overview, see ″Archive Inquiries.″

Purpose

Use **GPQACA** to inquire a list of structure identifiers that exist in both the currently selected structure store and the specified open archive file.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

arid — **specified by user, fullword integer**
> Archive file identifier.

start — **specified by user, fullword integer**
> The starting member in the list of structure identifiers (>=1).

number — **specified by user, fullword integer**
> Number of entries requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> | | |
> |---|---|
> | **7** | FUNCTION REQUIRES STATE AROP |
> | **12** | FUNCTION REQUIRES STATE SSSL |
> | **220** | SPECIFIED ARCHIVE FILE DOES NOT EXIST |
> | **538** | START VALUE < ONE |

GPQACS - Inquire All Conflicting Structures in Structure Store

GPQACS (*ssid*, *start*, *number*, *errind*, *totnum*, *istrid*)

Note: This subroutine is a Structure State List (SSL) inquiry. For an overview, see ″SSL Inquiries.″

Purpose

Use **GPQACS** to inquire a list of the structure identifiers that exist in both the currently selected structure store.

If the specified structure store identifier is the same as the currently selected structure store identifier, then this subroutine is functionally equivalent to the Inquire Structure Identifiers (**GPQSTI**) subroutine.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

ssid — **specified by user, fullword integer**
> Structure store identifier.

start — **specified by user, fullword integer**
> The starting member of the list of structure identifiers (>=1).

number — **specified by user, fullword integer**
> Number of entries requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:
>
> | | |
> |---|---|
> | **12** | FUNCTION REQUIRES STATE SSSL |
> | **222** | SPECIFIED STRUCTURE STORE DOES NOT EXIST |
> | **538** | START VALUE < ONE |

GPQAI - Inquire List of Available Application Image Formats

GPQAI (*start*, *number*, *errind*, *totnum*, *format*)

> **Note:** This subroutine is a graPHIGS API Description Table (PDT) inquiry. For an overview, see ″PDT Inquiries.″

Purpose

Use **GPQAI** to inquire the list of available application image formats.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

start — **specified by user, fullword integer**
 Starting member in the list of available application image formats (>=1).

number — **specified by user, fullword integer**
 Number of image formats requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
 Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

 538 START VALUE < ONE

 539 REQUESTED NUMBER < ZERO

 543 START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

totnum — **returned by the graPHIGS API, fullword integer**
 Total number of available application image formats.

format — **returned by the graPHIGS API, array of fullword integers**
 List of application image formats (`1=PIXEL_ARRAY`).

GPQAMO - Inquire Available Antialiasing Modes

| GPQAMO (*wstype*, *start*, *number*, *errind*, *totnum*, *mode*) |

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQAMO** to inquire the antialiasing facilities that are supported by the specified workstation.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
> Workstation type.

start — **specified by user, fullword integer**
> Starting member of the list of available antialiasing modes (>=1).

number — **specified by user, fullword integer**
> Number of antialiasing modes requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> | | |
> |---|---|
> | **23** | SPECIFIED WORKSTATION TYPE DOES NOT EXIST |

GPQANF - Inquire Annotation Facilities

GPQANF (*wstype*, *start*, *number*, *errind*, *totnum*, *styles*)

Note: This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQANF** to inquire the list of annotation styles that are supported by the specified workstation.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
Workstation type.

start — **specified by user, fullword integer**
Starting number of annotation styles (>=1).

number — **specified by user, fullword integer**
Number of annotation styles requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

23	SPECIFIED WORKSTATION TYPE DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
538	START VALUE < ONE
539	REQUESTED NUMBER < ZERO
543	START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED
548	SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

totnum — **returned by the graPHIGS API, fullword integer**
Total number of available annotation styles.

styles — **returned by the graPHIGS API, array of fullword integers**
List of annotation styles (`1=UNCONNECTED`, `2=LEAD_LINE`).

GPQAR - Inquire Set of Associated Roots

GPQAR (*wsid*, *start*, *number*, *errind*, *totnum*, *strid*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQAR** to inquire a list of structure identifiers which belong to the currently selected structure store and are associated with the workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
    Workstation identifier.

start — **specified by user, fullword integer**
    Starting member of the list of structure identifiers (>=1).

number — **specified by user, fullword integer**
    Number of structure identifiers requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
    Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
215	SPECIFIED RESOURCES DO NOT EXIST ON THE SAME NUCLEUS
227	STRUCTURE STORE IS NOT SELECTED
538	START VALUE < ONE
539	REQUESTED NUMBER < ZERO
543	START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

totnum — **returned by the graPHIGS API, fullword integer**
    Total number of roots associated to the workstation.

strid — **returned by the graPHIGS API, array of fullword integers**
    List of root structure identifiers.

GPQARF - Inquire Archive Files

GPQARF (*start*, *number*, *buflen*, *errind*, *actnum*, *totnum*, *arlist*, *termcond*)

> **Note:** This subroutine is an Archive inquiry. For an overview, see *"Archive Inquiries."*

Purpose

Use **GPQARF** to inquire a list of open archive files.

If the current archive state is archive closed (ARCL), then the graPHIGS API returns a value of zero for the total number of open archive files (*totnum*).

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

start — **specified by user, fullword integer**
> The starting member in the list of structure identifiers (>=1).

number — **specified by user, fullword integer**
> Number of entries requested (>=0).

buflen — **specified by user, fullword integer**
> Length, in bytes, of the data area specified by the *arlist* parameter into which the graPHIGS API returns the archive file names (>=0).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> | | |
> |---|---|
> | **538** | START VALUE < ONE |
> | **539** | REQUESTED NUMBER < ZERO |
> | **543** | START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED |
> | **577** | BUFFER LENGTH IS < ZERO |

actnum — **returned by the graPHIGS API, fullword integer**
> Total number of archive file names returned.

totnum — **returned by the graPHIGS API, fullword integer**
> Total number of open archive files.

arlist — **returned by the graPHIGS API, variable data**

List of entries for the requested archive files. The value of each field is expressed in the following data format:

```
 --------------
|   entry 1    |
|------------- |
|   entry 2    |
|------------- |
Z              Z
|              |
|------------- |
|   entry n    |
|  (n=actnum)  |
 --------------
```
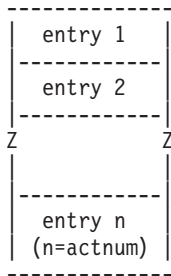

where each entry has the following format:

```
    -----------------
 0 |length of entry|  Fullword integer
   |---------------|
 4 |archive file id|  Fullword integer
   |---------------|
 8 |   length of   |  Fullword integer
   |   descriptor  |
   |---------------|
12 |   descriptor  |  Character data
    -----------------
```
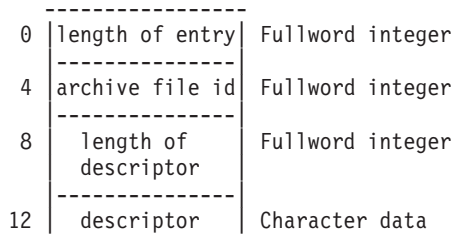

The graPHIGS API pads each archive file descriptor with blanks to align the next length field on a fullword boundary.

termcond — **returned by the graPHIGS API, fullword integer**

Termination condition. The graPHIGS API terminated the list of archive file names due to one of the following reasons:

1- Count Exhausted

The graPHIGS API returned the requested number of archive file names.

2- Buffer Overflow

The graPHIGS API count not return the requested number of elements because there was not enough room in the area provided. *actnum* contains the actual number returned.

3- End of List of Archive Files

The graPHIGS API reached the last archive file in the list. This condition supersedes the Count Exhausted condition (if that condition was in effect). The total number of archive files returned may not be equal to the number of returned archive files you requested. Check *actnum* to find the actual number of archive files returned.

GPQART - Inquire Rendering Targets

GPQART (*wstype, errind, totnum*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQART** to inquire the number of rendering targets that are available on the specified workstation for explicit control by an application. A rendering target is a repository for the 'picture' produced by rendering primitives and their attributes. Rendering targets may be frame buffers or disk files. Implicit in the workstation type is the type of rendering target that is available on the workstation. A workstation does not support multiple types of rendering targets.

Each available rendering target on a workstation has an associated identifier. The identifiers are from one to *totnum* (which is the total number of rendering targets available on the workstation). When you open a workstation, the current displayed rendering target and the current selected rendering target are the same.

Parameters

wstype — **specified by user, 8-byte character string**
      Workstation type.

errind — **specified by user, fullword integer**
      Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

23	SPECIFIED WORKSTATION TYPE DOES NOT EXIST
548	SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

totnum — **returned by the graPHIGS API, fullword integer**
      Total number of rendering targets available for explicit control by the application. (Zero indicates that there are no rendering targets are available for explicit control by the application.)

GPQASV - Inquire Archive State Value

GPQASV (*state*)

> **Note:** This subroutine is a graPHIGS API State List (PSL) inquiry. For an overview, see ″PSL Inquiries.″

Purpose

Use **GPQASV** to inquire the archive state of the graPHIGS API. The archive state is either Archive Open (2=AROP) or Archive Closed (1=ARCL). If the state is AROP, then at least one archive file is open. If the state is ARCL, then no archive files are open.

Parameters

state — **specified by user, fullword integer**
>   Archive state value (1=ARCL, 2=AROP).

Error Codes

None

GPQATR - Inquire List of Attached Resources

GPQATR (*ncid*, *type*, *start*, *number*, *errind*, *totnum*, *id*)

>   **Note:** This subroutine is a graPHIGS API State List (PSL) inquiry. For an overview, see ″PSL Inquiries.″

Purpose

Use **GPQATR** to inquire the list of resources of the specified type in the specified nucleus that are attached to the shell.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

>   **Note:** The Inquire Set of Open Workstations (**GPQOPW**) subroutine is treated as a special form of this generic subroutine. It inquires the set of workstation resources in the nucleus with an identifier of 1.

Parameters

ncid — **specified by user, fullword integer**
>   Nucleus identifier.

type — **specified by user, fullword integer**
>   Resource type (1=WORKSTATION, 2=STRUCTURE_STORE, 3=IMAGE_BOARD, 4=FONT_DIRECTORY, 5=ARCHIVE_FILE).

start — **specified by user, fullword integer**
> Starting member in the list of attached resources (>=1).

number — **specified by user, fullword integer**
> Number of shell resource identifiers requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> | | |
> |---|---|
> | **202** | SPECIFIED NUCLEUS DOES NOT EXIST |
> | **211** | RESOURCE TYPE IS INVALID |
> | **538** | START VALUE < ONE |
> | **539** | REQUESTED NUMBER < ZERO |
> | **543** | START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED |

totnum — **returned by the graPHIGS API, fullword integer**
> Total number of attached resources of the specified resource type.

id — **returned by the graPHIGS API, array of fullword integers**
> List of identifiers belonging to the specified resource type.

GPQBK - Inquire Break Capabilities

GPQBK (*wstype, start, number, errind, ntrigs, ltrigs*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQBK** to inquire the break action capabilities for the specified workstation type. If the break action is programmable, the available triggers are returned.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
> Workstation type.

start — **specified by user, fullword integer**
> Starting member in the list of available triggers (>=1).

number — **specified by user, fullword integer**
> Number of trigger list entries requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **23** SPECIFIED WORKSTATION TYPE DOES NOT EXIST

> **38** WORKSTATION HAS ONLY OUTPUT CAPABILITIES

> **538** START VALUE < ONE

> **539** REQUESTED NUMBER < ZERO

> **543** START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

> **548** SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

> **572** WORKSTATION DOES NOT SUPPORT PROGRAMMABLE BREAK ACTION

ntrigs — **returned by the graPHIGS API, fullword integer**
> Number of entries in the available triggers list.

ltrigs — **returned by the graPHIGS API, array of fullword integers**
> List of available triggers (positive integers are button device numbers). The list is an array of trigger descriptors in which a descriptor consists of a triplet (3 fullword integers) containing the trigger type, low trigger qualifier, and high trigger qualifier. Positive integers as trigger types are button device numbers. The trigger qualifier for a choice device is the choice number. The parameter *ntrigs* identifies the total number of triplets in the available trigger list. The actual number returned depends on the setting of the *start* and *number* parameters.

GPQBKS - Inquire Break Action State

GPQBKS (*wsid, errind, trigger*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see "WSL Inquiries."

Purpose

Use **GPQBKS** to inquire the current break action trigger on the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **25** SPECIFIED WORKSTATION DOES NOT EXIST

> **38** WORKSTATION HAS ONLY OUTPUT CAPABILITIES

trigger — **returned by the graPHIGS API, 2 fullword integers**
> Trigger to be used on the specified workstation for the break action. The trigger consists of a trigger type followed by a trigger qualifier. Positive integers as trigger types are button device numbers. The trigger qualifier for a button device is the choice alternative.

GPQCCH - Inquire Color Table Characteristics

GPQCCH (*wsid, ctid, errind, model, length*)

Note: This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQCCH** to inquire the current characteristics of the specified color table on the workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

ctid — **specified by user, fullword integer**
> Color table identifier (`-1=DISPLAY_COLOR_TABLE_MODIFIABLE`,
> `0=RENDERING_COLOR_TABLE_MODIFIABLE`).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **25**   SPECIFIED WORKSTATION DOES NOT EXIST

> **35**   WORKSTATION HAS ONLY INPUT CAPABILITIES

> **284**   COLOR TABLE IDENTIFIER DOES NOT EXIST

model — **returned by the graPHIGS API, fullword integer**
> Color model (`1=RGB`, `2=HSV`, `3=CMY`, `4=CIELUV`).

length — **returned by the graPHIGS API, fullword integer**
> Length of the color table in $\log_2$.

GPQCDF - Inquire Curve Display Facilities

GPQCDF (*wstype*, *start*, *number*, *errind*, *order*, *totnum*, *criteria*)

Note: This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQCDF** to inquire the curve facilities of the specified workstation type.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
 Workstation type.

start — **specified by user, fullword integer**
 Starting member of the list of available curve approximation criteria (>=1).

number — **specified by user, fullword integer**
 Number of curve approximation criteria requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
 Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

 23 SPECIFIED WORKSTATION TYPE DOES NOT EXIST

 35 WORKSTATION HAS ONLY INPUT CAPABILITIES

 538 START VALUE < ONE

 539 REQUESTED NUMBER < ZERO

 543 START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

 548 SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

order — **returned by the graPHIGS API, fullword integer**
 Maximum curve order supported.

totnum — **returned by the graPHIGS API, fullword integer**
 Total number of available curve approximation criteria.

criteria — **returned by the graPHIGS API, array of fullword integers**
 List of curve approximation criteria (1=WORKSTATION_DEPENDENT, 3=CONSTANT_SUBDIVISION_BETWEEN_KNOTS, 8=VARIABLE_SUBDIVISION_BETWEEN_KNOTS).

GPQCEV - Inquire Current Event

GPQCEV (*major*, *class*, *minor*)

> **Note:** This subroutine is a graPHIGS API State List (PSL) inquiry. For an overview, see ″PSL Inquiries.″

Purpose

Use **GPQCEV** to inquire information about the current event report.

When the current event report is empty, the graPHIGS API returns a zero for the event class parameter and major/minor code parameters are not set. Otherwise, the graPHIGS API returns an event class of the event in the current event report to the event class parameter.

The details of the possible event classes and meanings of their major and minor codes are shown in *The graPHIGS Programming Interface: Technical Reference*.

Parameters

major — **returned by the graPHIGS API, fullword integer**
    Major event code.

class — **returned by the graPHIGS API, fullword integer**
    Event class.

minor — **returned by the graPHIGS API, fullword integer**
    Minor event code.

GPQCF - Inquire Color Facilities

GPQCF (*wstype*, *errind*, *model*, *ncolor*, *avcolor*, *npred*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQCF** to inquire the color facilities of the specified workstation type.

The graPHIGS API returns the default color model of the workstation (*model*[default], the total quantity of available colors (*ncolor*[default], the color status (*avcolor*) where 1=MONOCHROME, 2=COLOR, and the quantity of predefined color table entries in the workstation's default color table (*npred*).

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype **— specified by user, 8-byte character string**
    Workstation type.

errind **— returned by the graPHIGS API, fullword integer**
    Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

    23   SPECIFIED WORKSTATION TYPE DOES NOT EXIST

    35   WORKSTATION HAS ONLY INPUT CAPABILITIES

    548   SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

model **— returned by the graPHIGS API, fullword integer**
    Color model of the workstation (1=RGB, 2=HSV, 3=CMY, 4=CIELUV).

ncolor **— returned by the graPHIGS API, fullword integer**
    Number of available colors (the total color palette size).

avcolor **— returned by the graPHIGS API, fullword integer**
    Color available (1=MONOCHROME, 2=COLOR).

npred **— returned by the graPHIGS API, fullword integer**
    Number of predefined default color table entries.

GPQCH - Inquire Choice Device State

GPQCH (*wsid, device, type, length, errind, mode, echosw, choice, echo, area, datalen, data*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQCH** to inquire the current state of the specified choice device on the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 533 (an output parameter is not large enough for all the requested data), then the values up to the length specified are returned. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

device — **specified by user, fullword integer**
> Choice device number (>=1).

type — **specified by user, fullword integer**
> Type of returned values (1=SET).

length — **specified by user, fullword integer**
> Length of choice data record array requested in bytes.

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> | | |
> |---|---|
> | **25** | SPECIFIED WORKSTATION DOES NOT EXIST |
> | **38** | WORKSTATION HAS ONLY OUTPUT CAPABILITIES |
> | **140** | DEVICE NUMBER < ONE OR DEVICE NOT AVAILABLE |
> | **509** | DATA LENGTH VALUE < ZERO OR REQUIRED LENGTH |
> | **533** | INQUIRY DATA EXCEEDS AREA. OUTPUT TRUNCATED |
> | **534** | TYPE VALUE IS INVALID |

mode — **returned by the graPHIGS API, fullword integer**
> Current operating mode (1=REQUEST, 2=SAMPLE, 3=EVENT, 4=APPLICATION_DEFINED). The graPHIGS API only returns a mode of 4=APPLICATION_DEFINED if the application set the device mode using the Set Input Device State (**GPIDMO**) subroutine and the mode does not emulate Request, Sample or Event mode.

echosw — **returned by the graPHIGS API, fullword integer**
> Current echo switch (1=NOECHO, 2=ECHO).

choice — **returned by the graPHIGS API, fullword integer**
> Current initial choice number.

echo — **returned by the graPHIGS API, fullword integer**
> Current prompt/echo type.

area — **returned by the graPHIGS API, 6 short floating-point numbers (DC)**
> Current echo area (Xmin, Xmax, Ymin, Ymax, Zmin, Zmax).

datalen — **returned by the graPHIGS API, fullword integer**
> Current choice data record length in bytes.

data — **returned by the graPHIGS API, variable length data**
> Current choice data record.

GPQCID - Inquire List of Color Table Identifiers

GPQCID (*wsid*, *start*, *number*, *errind*, *totnum*, *ctid*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQCID** to inquire the list of color table identifiers existing on the specified workstation.

Color table identifiers that may exist on a workstation include: `-1=DISPLAY_COLOR_TABLE`, `0=RENDERING_COLOR_TABLE`.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

start — **specified by user, fullword integer**
Starting member of the list of existing color tables (>=1).

number — **specified by user, fullword integer**
Number of color table identifiers requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
538	START VALUE < ONE
539	REQUESTED NUMBER < ZERO
543	START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

GPQCMM - Inquire List of Available Connection Methods

GPQCMM (*start*, *number*, *errind*, *totnum*, *conn*)

> **Note:** This subroutine is a graPHIGS API Description Table (PDT) inquiry. For an overview, see ″PDT Inquiries.″

Purpose

Use **GPQCMM** to determine the list of connection methods available to the application process when connecting to a nucleus.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

start — **specified by user, fullword integer**
Starting member in the list of available connection methods (>=1).

number — **specified by user, fullword integer**
Number of connection methods requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

538   START VALUE < ONE

539   REQUESTED NUMBER < ZERO

543   START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

totnum — **returned by the graPHIGS API, fullword integer**
Total number of available connection methods.

conn — **returned by the graPHIGS API, array of fullword integers**

GPQCNA - Inquire Conflicting Structures in Network in Archive

> GPQCNA (*arid*, *strid*, *source*, *start*, *number*, *errind*, *totnum*, *istrid*)

>**Note:** This subroutine is an Archive inquiry. For an overview, see ″Archive Inquiries.″

Purpose

Use **GPQCNA** to inquire a list of structure identifiers from a specified structure network that exists in both the currently selected structure store and the specified open archive file.

The value for the source determines whether the structure network originates from the currently selected structure store or from the archive file.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

arid — **specified by user, fullword integer**
>Archive file identifier.

strid — **specified by user, fullword integer**
>Structure identifier of the root structure.

source — **specified by user, fullword integer**
>The source of the structure network to be searched:

Value	Meaning
1	Currently selected structure store
2	Archive file

start — **specified by user, fullword integer**
>The starting member of the list of structure identifiers (>=1).

number — **specified by user, fullword integer**
>Number of entries requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
>Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

>| 7	FUNCTION REQUIRES STATE AROP
12	FUNCTION REQUIRES STATE SSSL
122	STRUCTURE IDENTIFIER DOES NOT EXIST

135   VALUE OF SOURCE IS INVALID

220   SPECIFIED ARCHIVE FILE DOES NOT EXIST

538   START VALUE < ONE

539   REQUESTED NUMBER < ZERO

543   START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

totnum — **returned by the graPHIGS API, fullword integer**
    Total number of conflicting structures in the network.

istrid — **returned by the graPHIGS API, array of fullword integers**

GPQCNC (*start*, *number*, *errind*, *totnum*, *ncid*)

> **Note:** This subroutine is a graPHIGS API State List (PSL) inquiry. For an overview, see ″PSL Inquiries.″

Purpose

Use **GPQCNC** to inquire the nuclei that are connected to the application process (shell).

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

start — **specified by user, fullword integer**
    Starting member in the list of connected nuclei (>=1).

number — **specified by user, fullword integer**
    Number of nucleus identifiers requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
    Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

538   START VALUE < ONE

539   REQUESTED NUMBER < ZERO

543   START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

totnum **— returned by the graPHIGS API, fullword integer**

GPQCNR - Inquire Conflict Resolution

GPQCNR (*aflag*, *rflag*)

> **Note:** This subroutine is an Archive inquiry. For an overview, see *"Archive Inquiries."*

Purpose

Use **GPQCNR** to inquire the archive file conflict resolution values of the graPHIGS API.

There are two conflict resolution flags that return values: *aflag* is used when the graPHIGS API moves structure data *to* an archive file from a structure store and *rflag* is used when the graPHIGS API moves archive data *from* an archive file to a structure store. The possible return values are: 1=MAINTAIN, 2=ABANDON, and 3=UPDATE.

• If the value returned is 1=MAINTAIN, then the graPHIGS API only transfers the structures that do not conflict.

• If the value returned is 2=ABANDON, then the graPHIGS API does not transfer any structures when a conflict occurs.

• If the value returned is 3=UPDATE, then the graPHIGS API transfers all the structures and replaces any conflicting structures with the new ones.

Parameters

aflag **— returned by the graPHIGS API, fullword integer**
    Archive conflict resolution(1=MAINTAIN, 2=ABANDON, 3=UPDATE).

rflag **— returned by the graPHIGS API, fullword integer**
    Retrieve conflict resolution (1=MAINTAIN, 2=ABANDON, 3=UPDATE).

GPQCPF - Inquire Color Processing Facilities

GPQCPF (*wstype*, *errind*, *number*, *npred*)

>   **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQCPF** to inquire the color processing mode table facilities supported by the specified workstation.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype **— specified by user, 8-byte character string**
>   Workstation type.

errind **— returned by the graPHIGS API, fullword integer**
>   Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> | 23 | SPECIFIED WORKSTATION TYPE DOES NOT EXIST |
> |---|---|
> | 35 | WORKSTATION HAS ONLY INPUT CAPABILITIES |
> | 548 | SPECIFIED WORKSTATION TYPE CANNOT BE LOADED |

number **— returned by the graPHIGS API, fullword integer**
>   Number of definable color processing mode table entries. Entry 0 of the color processing table may not be changed.

npred **— returned by the graPHIGS API, fullword integer**
>   Number of predefined color processing mode table entries.

Error Codes

GPQCPR - Inquire Color Processing Representation

> **GPQCPR (*wsid*, *index*, *errind*, *model*, *quant*, *data*)**

Note: This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQCPR** to inquire the current attribute values in the specified entry in the color processing table of the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

index — **specified by user, fullword integer**
> Color processing table index (>=0).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **25** SPECIFIED WORKSTATION DOES NOT EXIST

> **35** WORKSTATION HAS ONLY INPUT CAPABILITIES

> **265** COLOR PROCESSING INDEX < ZERO

> **266** COLOR PROCESSING INDEX EXCEEDS THE WORKSTATION TABLE CAPACITY

model — **returned by the graPHIGS API, fullword integer**
> Rendering color model (1=`RGB_NORMAL`, 2=`RGB_B_ONLY`).

quant — **returned by the graPHIGS API, fullword integer**

> Quantization method (1=WORKSTATION_DEPENDENT, 2=BITWISE).

data — **returned by the graPHIGS API, variable data**

> Quantization parameters. Values returned to this parameter depend on the quantization method. The application must supply storage for this parameter that is large enough to contain the maximum data listed below.

> **If *quant*=1 (WORKSTATION_DEPENDENT)**
>
> > The *data* parameter should be ignored.

> **If *quant*=2 (BITWISE)**
>
> > The *data* parameter returns the following format:

```
            --------------
     0  |R bit length|  fullword integer
        |------------|
     4  |G bit length|  fullword integer
        |------------|
     8  |B bit length|  fullword integer
        |------------|
    12  |padding bits|  fullword integer
            --------------
```

> > **Note:** The least significant (right most) bits of the padding data will be used.

GPQCQM - Inquire Available Color Quantization Methods

GPQCQM (*wstype*, *start*, *number*, *errind*, *totnum*, *method*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQCQM** to inquire a list of available color quantization methods supported by the specified workstation.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
        Workstation type.

start — **specified by user, fullword integer**
        Starting member of the list of available color quantization methods (>=1).

number — **specified by user, fullword integer**
        Number of color quantization methods requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
        Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

        23   SPECIFIED WORKSTATION TYPE DOES NOT EXIST

        35   WORKSTATION HAS ONLY INPUT CAPABILITIES

        538   START VALUE < ONE

        539   REQUESTED NUMBER < ZERO

        543   START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

        548   SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

totnum — **returned by the graPHIGS API, fullword integer**
        Total number of available color quantization methods.

method — **returned by the graPHIGS API, array of fullword integers**
        List of color quantization methods (1=WORKSTATION_DEPENDENT, 2=BITWISE).

GPQCSN - Inquire All Conflicting Structures in Network in Structure Store

---
GPQCSN (*ssid*, *strid*, *source*, *start*, *number*, *errind*, *totnum*, *istrid***)**

> **Note:** This subroutine is a Structure State List (SSL) inquiry. For an overview, see *"SSL Inquiries."*

Purpose

Use **GPQCSN** to inquire a list of the structure identifiers from a specified structure network that exists in both the currently selected structure store and the specified structure store.

The value of the *source* parameter determines whether the structure network originates from the currently selected structure store (1) or from the specified structure store (2).

If the specified structure store identifier is the same as the currently selected structure store identifier, then this subroutine is functionally equivalent to the Inquire Identifiers of Structures in Network (**GPQISN**) subroutine.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

ssid — **specified by user, fullword integer**
        Structure store identifier.

strid — **specified by user, fullword integer**
        Structure identifier of the root structure.

source — **specified by user, fullword integer**
        The source of the structure network to be searched:

Value	Meaning
1	Currently selected structure store
2	Specified structure store

start — **specified by user, fullword integer**
        The starting member of the list of structure identifiers (>=1)

number — **specified by user, fullword integer**
        Number of entries requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
        Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

        12   FUNCTION REQUIRES STATE SSSL

        122   STRUCTURE IDENTIFIER DOES NOT EXIST

        135   VALUE OF SOURCE IS INVALID

        222   SPECIFIED STRUCTURE STORE DOES NOT EXIST

        538   START VALUE < ONE

        539   REQUESTED NUMBER < ZERO

        543   START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

totnum — **returned by the graPHIGS API, fullword integer**
        Total number of conflicting structures in network.

istrid — **returned by the graPHIGS API, array of fullword integers**
        List of conflicting structure identifiers.

Error Codes

GPQCSR - Inquire Cull Size Representation

GPQCSR (*wsid*, *index*, *type*, *errind*, *size*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see "WSL Inquiries."

Purpose

Use **GPQCSR** to inquire the current cull size in the specified entry in the cull size table of the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
    Workstation identifier.

index — **specified by user, fullword integer**
    Cull size table index (>=1)

type — **specified by user, fullword integer**
    Type of returned value (1=SET).

errind — **returned by the graPHIGS API, fullword integer**
    Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

    25   SPECIFIED WORKSTATION DOES NOT EXIST

    35   WORKSTATION HAS ONLY INPUT CAPABILITIES

    278   CULL SIZE INDEX < ONE

    279   CULL SIZE INDEX EXCEEDS THE WORKSTATION TABLE CAPACITY

    534   TYPE VALUE IS INVALID

size — **returned by the graPHIGS API, short floating-point number (DC)**
        Cull size.

GPQCUF - Inquire Cursor Facilities

GPQCUF (*wstype, start1, num1, start2, num2, errind, maxent, maxsize, totnum1, lformat, totnum2, lcursor, npred*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQCUF** to inquire the cursor definition facilities for the specified workstation type.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
        Workstation type.

start1 — **specified by user, fullword integer**
        Starting member of the list of available cursor definition formats (>=1).

num1 — **specified by user, fullword integer**
        Number of entries from the list of available cursor definition formats that are requested (>=0).

start2 — **specified by user, fullword integer**
        Starting member of the list of available fixed cursor types (>=1).

num2 — **specified by user, fullword integer**
        Number of entries from the list of available fixed cursor types that are requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> | 23 | SPECIFIED WORKSTATION TYPE DOES NOT EXIST |
> |---|---|
> | 37 | WORKSTATION IS NOT OF CATEGORY OUTIN |
> | 538 | START VALUE < ONE |
> | 539 | REQUESTED NUMBER < ZERO |
> | 543 | START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED |

maxent — **returned by the graPHIGS API, fullword integer**
> Maximum number of cursor shape table entries.

maxsize — **returned by the graPHIGS API, fullword integer**
> Maximum number of bytes that a cursor definition may occupy.

totnum1 — **returned by the graPHIGS API, fullword integer**
> Total number of available cursor definition formats.

lformat — **returned by the graPHIGS API, array of fullword integers**
> List of available cursor definition formats. Each entry of this array consists of three integers. The first one will always be a format identifier. The meaning of the other two words is dependent on the value of the first word.

> **Format 1 -**
>> Words 2 and 3 are the required *x* size and *y* size respectively of the pixel array which defines the cursor shape.

totnum2 — **returned by the graPHIGS API, fullword integer**
> Total number of available fixed cursor types.

lcursor — **returned by the graPHIGS API, array of fullword integers**
> List of available fixed cursor types.

> Possible available fixed cursor types are:
> - -1=Cross hair cursor.

npred — **returned by the graPHIGS API, array of fullword integers**

GPQCVE - Inquire Current View Table Entries Input

GPQCVE (*wsid*, *start*, *number*, *errind*, *nview*, *view*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see *"WSL Inquiries."*

Purpose

Use **GPQCVE** to inquire the current view table indexes in input priority order for the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

start — **specified by user, fullword integer**
> Starting member of the list of view table entries (>=1).

number — **specified by user, fullword integer**
> Number of view table entries requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

GPQCVO - Inquire Current View Table Entries Output

GPQCVO (*wsid*, *start*, *number*, *errind*, *nview*, *view*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQCVO** to inquire the current view table indexes in output priority order for the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

start — **specified by user, fullword integer**
> Starting member of the list of view table entries (>=1).

number — **specified by user, fullword integer**

GPQCVR - Inquire Current View Representation

GPQCVR (*wsid*, *view*, *number*, *ids*, *errind*, *data*)

Note: This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQCVR** to inquire one or more fields from the specified current view table entry.

Each field in the view table entry is identified by a group identifier.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter in the requested order. The output parameter must be large enough to store all requested data.

If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

view — **specified by user, fullword integer**
View index (>=0).

number — **specified by user, fullword integer**
Number of groups requested (>=1).

ids — **specified by user, array of fullword integers**
A list of group identifiers requested.

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

25	SPECIFIED WORKSTATION DOES NOT EXIST
59	VIEW INDEX VALUE < ZERO
272	GROUP IDENTIFIER IS INVALID
273	NUMBER OF GROUP IDENTIFIERS < ONE
323	VIEW INDEX EXCEEDS VIEW TABLE CAPACITY
571	INQUIRED INFORMATION IS NOT AVAILABLE

data — **returned by the graPHIGS API, variable data**

Data array containing the values in the requested groups. The value of each field is expressed in the data format listed below:

Group Identifier 1 - Window clipping indicator

A fullword integer (1=NOCLIP, 2=CLIP)

Group Identifier 2 - Near clipping indicator

A fullword integer (1=NOCLIP, 2=CLIP)

Group Identifier 3 - Far clipping indicator

A fullword integer (1=NOCLIP, 2=CLIP)

Group Identifier 4 - Shielding indicator

A fullword integer (1=OFF, 2=ON)

Group Identifier 5 - Shielding color

Four fullwords of data with either of the following two formats:

```
        indexed format                    direct format
        -------------                     -------------
    0 |            1| fullword integer   0 |           2| fullword integer
      |-----------|                        |-----------|
    4 |color index| fullword integer     4 |component 1| short floating-point
number                                                   number
      |-----------|                        |-----------|
    8 |    ignored| fullword integer     8 |component 2| short floating-point
number                                                   number
      |-----------|                        |-----------|
   12 |    ignored| fullword integer    12 |component 3| short floating-point
number                                                   number
        -------------                     -------------
```

Group Identifier 6 - Border indicator

A fullword integer (1=OFF, 2=ON)

Group Identifier 7 - Border color

Four fullwords of data with either of the following two formats:

```
        indexed format                    direct format
        -------------                     -------------
    0 |            1| fullword integer   0 |           2| fullword integer
      |-----------|                        |-----------|
    4 |color index| fullword integer     4 |component 1| short floating-point
number                                                   number
      |-----------|                        |-----------|
    8 |    ignored| fullword integer     8 |component 2| short floating-point
number                                                   number
      |-----------|                        |-----------|
   12 |    ignored| fullword integer    12 |component 3| short floating-point
number                                                   number
        -------------                     -------------
```

Group Identifier 8 - Reserved.

This field is reserved.

Group Identifier 9 - Temporary view indicator

A fullword integer (1=OFF, 2=ON)

Group Identifier 10 - HLHSR mode

A fullword integer (1=OFF, 2=ON_THE_FLY)

Group Identifier 11 - Transparency processing mode

A fullword integer (1=OFF, 2=PARTIAL_TRANSPARENT, 3=BLEND, 4=BLEND_ALL)

Group Identifier 12 - Initial color processing mode index

A fullword integer (>=0)

Group Identifier 13 - Initial frame buffer write protect mask
> A 32-bit bit string.

Group Identifier 14 - Viewport, 2D form
> 4 short floating-point numbers (including only Xmin, Xmax, Ymin, Ymax). For the set subroutine, Zmin and Zmax are set to their default values.

Group Identifier 15 - Viewport, 3D form
> 6 short floating-point numbers (Xmin, Xmax, Ymin, Ymax, Zmin, Zmax)

Group Identifier 16 - View volume, 2D form
> 4 short floating-point numbers specifying the view window (Umin, Umax, Vmin, Vmax). For the set subroutine, other fields of the view volume group are set to their default values.

Group Identifier 17 - View volume, 3D form
> 10 short floating-point numbers and a fullword integer specifying a view window (Umin, Umax, Vmin, Vmax), near plane distance, far plane distance, projection reference point (*u, v, n*), view plane distance and a projection type (`1=PARALLEL, 2=PERSPECTIVE`)

```
----------------------
|        Umin        |  short floating-point number
|--------------------|
|        Umax        |  short floating-point number
|--------------------|
|        Vmin        |  short floating-point number
|--------------------|
|        Vmax        |  short floating-point number
|--------------------|
| near plane distance|  short floating-point number
|--------------------|
|  far plane distance|  short floating-point number
|--------------------|

|--------------------|
|   projection type  |  fullword integer
----------------------
```

Group Identifier 18 - View matrix, 2D form
> 9 short floating-point numbers. For the output view matrix, the elements are in the following order:

```
|m11  m12  m14|
|m21  m22  m24|  --->(m11,m12,m14,m21.....m44)
|m41  m42  m44|
```

> The output 3x3 matrix is extracted by the graPHIGS API from the 4[default]4 matrix of the three-dimensional form:

```
|m11  m12  m13  m14|
|m21  m22  m23  m24|  --->(m11,m12,m13,m14,m21,m22.....m44)
|m31  m32  m33  m34|
|m41  m42  m43  m44|
```

Group Identifier 19 - View matrix, 3D form
> 16 short floating-point numbers, M11, M12, M13. For the output view matrix, the elements are in the following order:

```
|m11  m12  m13  m14|
|m21  m22  m23  m24| --->(m11,m12,m13,m14,m21,m22.....m44)
|m31  m32  m33  m34|
|m41  m42  m43  m44|
```

Group Identifier 20 - View input active flag
A fullword integer (1=INACTIVE, 2=ACTIVE)

Group Identifier 21 - View output active flag
A fullword integer (1=INACTIVE, 2=ACTIVE)

Group Identifier 22 - View mapping matrix, 2D form
9 short floating-point numbers:

```
|m11  m12  m14|
|m21  m22  m24| --->(m11,m12,m14,m21.....m44)
|m41  m42  m44|
```

Group Identifier 23 - View mapping matrix, 3D form
16 short floating-point numbers:

```
|m11  m12  m13  m14|
|m21  m22  m23  m24| --->(m11,m12,m13,m14,m21,m22.....m44)
|m31  m32  m33  m34|
|m41  m42  m43  m44|
```

Group Identifier 24 - Antialiasing mode
A fullword integer (1=OFF, 2=ON)

Group Identifier 25 - Shield alpha value
A fullword integer (0<=$alpha$<=255)

GPQDBK - Inquire Default Break Action

GPQDBK (*wstype*, *errind*, *trigger*)

Note: This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQDBK** to inquire the default break action for the specified workstation type.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the graPHIGS API sets the error indicator (*errind*) to one of the error numbers to indicate the reason for the non-availability, and the values returned in the output parameters are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
> Workstation type.

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> | | |
> |---|---|
> | **23** | SPECIFIED WORKSTATION TYPE DOES NOT EXIST |
> | **38** | WORKSTATION HAS ONLY OUTPUT CAPABILITIES |
> | **548** | SPECIFIED WORKSTATION TYPE CANNOT BE LOADED |

trigger — **returned by the graPHIGS API, 2 fullword integers**
> Trigger to be used on the specified workstation for the break action. The trigger consists of a trigger type followed by a trigger qualifier. Positive integers as trigger types are button device numbers. The trigger qualifier for a button device is the choice alternative.

GPQDCF - Inquire Depth Cue Facilities

GPQDCF (*wstype*, *errind*, *number*, *npred*)

Note: This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see *″WDT Inquiries.″*

Purpose

Use **GPQDCF** to inquire the depth cue facilities for the specified workstation type.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype **— specified by user, 8-byte character string**
Workstation type.

errind **— specified by user, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

23	SPECIFIED WORKSTATION TYPE DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
548	SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

number **— returned by the graPHIGS API, fullword integer**
Number of definable depth cue table entries. Entry 0 of the depth cue table may not be changed.

npred **— returned by the graPHIGS API, fullword integer**
Number of predefined depth cue indexes.

GPQDCH - Inquire Default Choice Device Data

GPQDCH (*wstype, device, start, number, length, errind, choice, necho, echo, area, datalen, data*)

Note: This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQDCH** to inquire the default values of a requested choice device for the specified workstation type.

The graPHIGS API returns the default values for the requested choice device. For more information on the defaults, see *The graPHIGS Programming Interface: Technical Reference*.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 533 (an output parameter is not large enough for all the requested data), then the values up to the length specified are returned. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
　　Workstation type.

device — **specified by user, fullword integer**
　　Choice device number.

start — **specified by user, fullword integer**
　　Starting member of the list of prompt/echo types (>=1).

number — **specified by user, fullword integer**
　　Number of prompt/echo types requested (>=0).

length — **specified by user, fullword integer**
　　This refers to the length, in bytes, of the data array provided by the application for the graPHIGS API to return the data record.

errind — **returned by the graPHIGS API, fullword integer**
　　Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

23	SPECIFIED WORKSTATION TYPE DOES NOT EXIST
38	WORKSTATION HAS ONLY OUTPUT CAPABILITIES
140	DEVICE NUMBER < ONE OR DEVICE NOT AVAILABLE
509	DATA LENGTH VALUE < ZERO OR REQUIRED LENGTH
533	INQUIRY DATA EXCEEDS AREA. OUTPUT TRUNCATED
538	START VALUE < ONE
539	REQUESTED NUMBER < ZERO
543	START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED
548	SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

choice — **returned by the graPHIGS API, fullword integer**
> Maximum number of choice alternatives.

necho — **returned by the graPHIGS API, fullword integer**
> Total number of available prompt/echo types.

echo — **returned by the graPHIGS API, array of fullword integers**
> List of prompt/echo types. The output array must be large enough to contain the requested data.

area — **returned by the graPHIGS API, 6 short floating-point numbers (DC)**
> Default echo area (Xmin, Xmax, Ymin, Ymax, Zmin, Zmax)

datalen — **returned by the graPHIGS API, fullword integer**
> Default choice data record length, in bytes.

data — **returned by the graPHIGS API, variable length data**
> Default choice data record for the default prompt/echo type (1=TYPE).

GPQDCM - Inquire Direct Color Model

GPQDCM (*model*)

> **Note:** This subroutine is a graPHIGS API State List (PSL) inquiry. For an overview, see ″PSL Inquiries.″

Purpose

Use **GPQDCM** to inquire the current direct color model.

Parameters

model — **returned by the graPHIGS API, fullword integer**
> Current direct color model (1=RGB, 2=HSV, 3=CMY, 4=CIELUV).

GPQDCR - Inquire Depth Cue Representation

GPQDCR (*wsid, index, type, number, ids, errind, data*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see "WSL Inquiries."

Purpose

Use **GPQDCR** to inquire the current value of one or more fields in the specified depth cue table entry of the specified workstation's depth cue table. Each field is identified by a group identifier.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter in the requested order. The output parameter must be large enough to store all requested data.

If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
    Workstation identifier.

index — **specified by user, fullword integer**
    Depth cue table index (>=0).

type — **specified by user, fullword integer**
    Type of returned value (1=SET).

number — **specified by user, fullword integer**
    Number of group identifiers requested (>=1).

ids — **specified by user, array of fullword integers**
    A list of group identifiers.

errind — **returned by the graPHIGS API, fullword integer**
    Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
261	DEPTH CUE INDEX < ZERO
262	DEPTH CUE INDEX EXCEEDS THE WORKSTATION TABLE CAPACITY
272	GROUP IDENTIFIER IS INVALID
273	NUMBER OF GROUP IDENTIFIERS < ONE
534	TYPE VALUE IS INVALID

data — **returned by the graPHIGS API, variable data.**

Data array containing the values in the requested groups. The value of each field is expressed in the data format listed below:

Group identifier 1 - Depth cue mode

A fullword integer (`1=SUPPRESSED, 2=ALLOWED`).

Group identifier 2 - Depth cue reference planes

Two short floating-point numbers specifying the far and near depth cue reference plane distance.

Group identifier 3 - Depth cue scale factors

Two short floating-point numbers specifying two scale factors corresponding to the far and near reference planes.

Group identifier 4 - Depth cue color

Four fullwords of data with either of the following two formats:

```
      indexed format                        direct format
      -------------                         -------------
  0 |            1| fullword integer    0 |            2| fullword integer
    |-----------|                         |-----------|
  4 |color index| fullword integer      4 |component 1| short floating-point number
    |-----------|                         |-----------|
  8 |    ignored| fullword integer      8 |component 2| short floating-point number
    |-----------|                         |-----------|
 12 |    ignored| fullword integer     12 |component 3| short floating-point number
      -------------                         -------------

GPQDDV - Inquire Default Deferral State Values

GPQDDV (*wstype*, *errind*, *defer*, *modif*)

Note: This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQDDV** to inquire the default values of the deferral state and modification mode for the specified workstation type.

For information about deferral states and modification modes, see *The graPHIGS Programming Interface: Understanding Concepts*.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
> Workstation type.

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> | | |
> |---|---|
> | **23** | SPECIFIED WORKSTATION TYPE DOES NOT EXIST |
> | **35** | WORKSTATION HAS ONLY INPUT CAPABILITIES |
> | **548** | SPECIFIED WORKSTATION TYPE CANNOT BE LOADED |

defer — **returned by the graPHIGS API, fullword integer**
> Default value for deferral mode (1=ASAP, 2=BNIG, 3=BNIL, 4=ASTI, 5=WAIT).

modif — **returned by the graPHIGS API, fullword integer**
> Default value for modification mode (1=NO_IMMEDIATE_VISUAL_EFFECT, 2=UPDATE_WITHOUT_REGENERATION, 3=QUICK_UPDATE).

GPQDIT - Inquire Default Input Device Triggers

> GPQDIT (*wstype*, *class*, *devnum*, *listid*, *start*, *number*, *errind*, *ndtrigs*, *dtriglist*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQDIT** to inquire the default trigger list of a specified input device for the specified workstation type.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
> Workstation type.

class — **specified by user, fullword integer**
> Input device class (1=LOCATOR, 2=STROKE, 3=VALUATOR, 4=CHOICE, 5=PICK, 6=STRING).

devnum — **specified by user, fullword integer**
> Input device number (>=1).

listid — **specified by user, fullword integer**
> Trigger list identifier for return of default trigger list (>=0). Trigger list identifier zero is always present and is called the primary trigger. The primary trigger causes the input to be returned to the application.
>
> Secondary triggers may have different intermediate subroutines used in the processing of the input. They are identified with trigger list identifiers beginning with the value one.

start — **specified by user, fullword integer**
> Starting member in the list of default triggers (>=1).

number — **specified by user, fullword integer**
> Number of triggers requested from the trigger list (>=0).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:
>
> | | |
> |---|---|
> | **23** | SPECIFIED WORKSTATION TYPE DOES NOT EXIST |
> | **38** | WORKSTATION HAS ONLY OUTPUT CAPABILITIES |
> | **140** | DEVICE NUMBER < ONE OR DEVICE NOT AVAILABLE |
> | **328** | INPUT CLASS VALUE IS INVALID |
> | **538** | START VALUE < ONE |
> | **539** | REQUESTED NUMBER < ZERO |
> | **543** | START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED |
> | **548** | SPECIFIED WORKSTATION TYPE CANNOT BE LOADED |
> | **570** | SPECIFIED TRIGGER LIST IDENTIFIER DOES NOT EXIST |

ndtrigs — **returned by the graPHIGS API, fullword integer**
> Total number of triggers in the default trigger list.

dtriglist — **returned by the graPHIGS API, array of fullword integers**
> List of default trigger descriptor triplets. The list is an array of trigger descriptors in which a descriptor consists of a triplet (3 fullword integers) containing the trigger type, low trigger qualifier, and high trigger qualifier. Positive integers as trigger types are choice device numbers. The trigger qualifier for a choice device is the choice number. The parameter *ntrigs* identifies the total number of triplets in the available trigger list. The actual number returned will depend on the setting of the *start* and *number* parameters.

GPQDLC - Inquire Default Locator Device Data

GPQDLC (*wstype*, *device*, *start*, *number*, *length*, *errind*, *dimen*, *pos*, *necho*, *echo*, *area*, *datalen*, *data*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see "WDT Inquiries."

Purpose

Use **GPQDLC** to inquire the default value of the requested locator device for the specified workstation type.

The graPHIGS API returns the default values for the requested locator device. The default initial locator position is in view zero, which is the only active view by default. For more information on the defaults, see *The graPHIGS Programming Interface: Technical Reference*.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 533 (an output parameter is not large enough for all the requested data), then the values up to the length specified are returned. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype **— specified by user, 8-byte character string**
Workstation type.

device **— specified by user, fullword integer**
Locator device number.

start **— specified by user, fullword integer**
Starting member of the list of prompt/echo types (>=1).

number **— specified by user, fullword integer**
Number of prompt/echo types requested (>=0)

length **— specified by user, fullword integer**
Length of locator data record array, in bytes, provided by the application for the graPHIGS API to return data record (>=0).

errind — **returned by the graPHIGS API, fullword integer**

Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

23	SPECIFIED WORKSTATION TYPE DOES NOT EXIST
38	WORKSTATION HAS ONLY OUTPUT CAPABILITIES
140	DEVICE NUMBER < ONE OR DEVICE NOT AVAILABLE
509	DATA LENGTH VALUE < ZERO OR REQUIRED LENGTH
533	INQUIRY DATA EXCEEDS AREA. OUTPUT TRUNCATED
538	START VALUE < ONE
539	REQUESTED NUMBER < ZERO
543	START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED
548	SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

dimen — **returned by the graPHIGS API, fullword integer**

Type of locator device (1=2D, 2=3D).

pos — **returned by the graPHIGS API, 3 short floating-point numbers (WC)**

Default initial locator position.

necho — **returned by the graPHIGS API, fullword integer**

Total number of available prompt/echo types.

echo — **returned by the graPHIGS API, array of fullword integers**

List of available prompt/echo types requested. The output array must be large enough to contain the requested data.

area — **returned by the graPHIGS API, 6 short floating-point numbers (DC)**

Default echo area (Xmin, Xmax, Ymin, Ymax, Zmin, Zmax).

datalen — **returned by the graPHIGS API, fullword integer**

Default locator data record length, in bytes.

data — **returned by the graPHIGS API, variable length data**

Default locator data record for the default prompt/echo type (1=TYPE).

Error Codes

None

GPQDMR - Inquire Data Mapping Representation

GPQDMR (*wsid, index, lclengths, lcdata, errind, method, mdata, clengths, ctype, cdata*)

Note: This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQDMR** to inquire the current values in the specified entry of the workstation's data mapping table.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 533 (an output parameter is not large enough to hold the requested data), then the values up to the length specified are returned. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

If the *method* parameter has the value `1=DM_METHOD_COLOR`, then the graPHIGS API returns no additional data in the remaining parameters.

The data mapping table is 0 based; entry 0 always contains a data mapping method of `1=DM_METHOD_COLOR`.

Parameters

wsid — **specified by user, fullword integer**
    Workstation identifier.

index — **specified by user, fullword integer**
    Data mapping index (>= 0).

lclengths — **specified by user, fullword integer**
    Length, in bytes, of the specified *clengths* parameter (>=0).

lcdata — **specified by user, fullword integer**
    Length, in bytes, of the specified *cdata* parameter (>=0).

errind — **returned by the graPHIGS API, fullword integer**
    Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

3	FUNCTION REQUIRES STATE WSOP
25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
50	DATA MAPPING INDEX EXCEEDS WORKSTATION TABLE CAPACITY
509	DATA LENGTH VALUE < ZERO OR REQUIRED LENGTH
533	INQUIRY DATA EXCEEDS AREA. OUTPUT TRUNCATED
630	DATA MAPPING INDEX < ZERO

method — **returned by the graPHIGS API, fullword integer**
    Data mapping method (`-1=IMAGE_ARRAY`, `1=DM_METHOD_COLOR`, `2=SINGLE_VALUE_UNIFORM`, `4=BI_VALUE_UNIFORM`).

mdata — **returned by the graPHIGS API, variable data.**
    Data mapping method descriptor. The data returned in this parameter has one of the following formats, depending on the returned data mapping method (*method*):

    `-1=IMAGE_ARRAY`

    The following data is returned:

```
                    --------------------
        WORDS 1     |     'udindex'     |    Fullword integer
                    |-------------------|
              2     |     'vdindex'     |    Fullword integer
                    |-------------------|
              3     |      'ulolim'     |    Floatingpoint number
                    |-------------------|
              4     |      'uhilim'     |    Floatingpoint number
                    |-------------------|
              5     |      'vlolim'     |    Floatingpoint number
                    |-------------------|
              6     |      'vhilim'     |    Floatingpoint number
                    --------------------
```

udindex
>   Index into the primitive's data list for the *u* data value.

vdindex
>   Index into the primitive's data list for the *v* data value.

ulolim   Lower limit of the *u* data mapping range.

uhilim   Upper limit of the *u* data mapping range.

vlolim   Lower limit of the *v* data mapping range.

vhilim   Upper limit of the *v* data mapping range.

>   1=DM_METHOD_COLOR

>   N/A (No data mapping descriptor is returned for this method.)

>   2=SINGLE_VALUE_UNIFORM

>   The following data is returned:

```
                    --------------------
        WORDS 1     |      'dindex'     |    Fullword integer
                    |-------------------|
              2     |      'lolim'      |    Floatingpoint number
                    |-------------------|
              3     |      'hilim'      |    Floatingpoint number
                    --------------------
```

dindex   Index into the primitive's data list.

lolim   Lower limit of the data mapping range.

hilim   Upper limit of the data mapping range.

>   4=BI_VALUE_UNIFORM

>   The data mapping record returned is identical to -1=IMAGE_ARRAY.

clengths — **returned by the graPHIGS API, variable data**
>   Data mapping color data lengths. The format of this parameter is dependent on the *method* parameter:

>   -1=IMAGE_ARRAY

>   The following data is returned:

```
                    --------------------
        WORDS 1     |      'x_size'     |    Fullword integer
                    |-------------------|
              2     |      'y_size'     |    Fullword integer
                    |-------------------|
              3     |      'oformat'    |    Fullword integer
                    --------------------
```

x_size x dimension of the base color data array.

y_size y dimension of the base color data array.

oformat

Data organization format (1=BASE_DATA, 2=SQUARE_MM, 3=RECT_MM). This format determines the filtering methods which may be used.

1=DM_METHOD_COLOR

No data is returned

2=SINGLE_VALUE_UNIFORM

The following data is returned:

```
              ---------------------
   WORD  1    |      'n_ent'      |  Fullword Integer
              ---------------------
```

n_ent The number of entries in the color data list.

4=BI_VALUE_UNIFORM

The following data is returned:

```
              ---------------------
   WORDS 1    |     'n_lists'     |  Fullword integer
              |-------------------|
        2-n   |     'n_ent'       |   n_lists *
              Z                   Z  Fullword integer
              |                   |
              ---------------------
```

n_lists The number of lists of data values.

n_ent A list of fullword integers that specify the number of entries of each color data list. There are *n_lists* entries in this list.

ctype — returned by the graPHIGS API, fullword integer

Data mapping color data type. Ignore this parameter if the method returned is 1=DM_METHOD_COLOR. Returned types are:

1=TYPE_COLOR

Colors consist of three short floating-point numbers in the current workstation color model (0.0<=color_component<=1.0).

2=TYPE_PACKED_RGB

Colors consist of four bytes. The first three bytes represent the red, green, and blue color components respectively; the fourth byte is ignored.

3=TYPE_COLOR_TRANS

Colors consist of four short floating-point numbers. The first three numbers represent the color in the current workstation color model (0.0<=color_component<=1.0); the fourth number represents the transparency coefficient (0.0<=transparency_coefficient<=1.0).

4=TYPE_PACKED_RGB_ALPHA

Colors consist of four bytes. The first three bytes represent the red, green, and blue color components respectively; the fourth byte is an unsigned integer alpha ([default]) blending value that may be derived from a transparency coefficient as follows:

Alpha=X'FF' x (1.0-transparency_coefficient)

(Alpha=X'00') is fully transparent and equivalent to (transparency_coefficient=1.0).
(Alpha=X'FF') is fully opaque and equivalent to (transparency_coefficient=0.0).

cdata — **returned by the graPHIGS API, variable data**

> Data mapping color data. The data mapping color data organization is defined by the *clengths* and *ctype* parameters returned on this subroutine.
>
> The 2=SINGLE_VALUE_UNIFORM and 4=BI_VALUE_UNIFORM color lists are supplied from the *lolim* lower limits to the *hilim* upper limits. For example, the color representing the data value *lolim* is first in each list, and the color representing *hilim* is last. See Figure 8 and Figure 9. The number of color values in each SINGLE_VALUE_UNIFORM color list is given by *n_ent*.

> **Figure 8. SINGLE_VALUE_UNIFORM Color Data Organization**

```

        -+--------------+-->
        ulolim        uhilim
           U Data Value
```

`SQUARE_MM` color mipmap data is supplied in the same fashion, starting with the base image and continuing with each successively smaller mipmap image, until either *x_size* or *y_size* is equal to one. See Figure 11. The number of color values in this complete array is

$$(x\_size * y\_size) + (x\_size * y\_size)/4 + (x\_size * y\_size)/16 + ...$$

which reduces to the integer portion of

$$((4 * x\_size * y\_size) - (MAX(x\_size,y\_size) / MIN(x\_size,y\_size))) / 3$$

Figure 11. IMAGE_ARRAY SQUARE_MM Color Data Organization
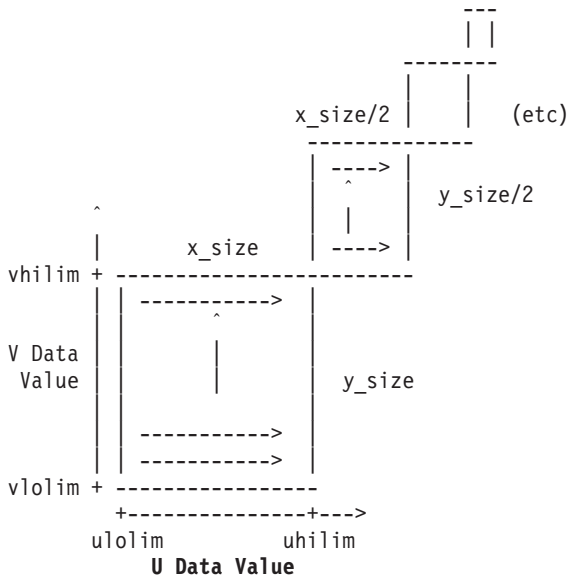

```

GPQDPK - Inquire Default Pick Device Data

> GPQDPK (*wstype*, *device*, *start*, *number*, *length*, *errind*, *maxpath*, *necho*, *echo*, *area*, *datalen*, *data*)

Note: This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQDPK** to return the default values of the specified pick device for the specified workstation type.

The graPHIGS API returns the default values for the requested pick device. For more information on defaults, see *The graPHIGS Programming Interface: Technical Reference*.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 533 (an output parameter is not large enough for all the requested data), then the values up to the length specified are returned. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
> Workstation type.

device — **specified by user, fullword integer**
> Pick device number.

start — **specified by user, fullword integer**
> Starting member of the list of prompt/echo types (>=1).

number — **specified by user, fullword integer**
> Number of prompt/echo types requested (>=0).

length — **specified by user, fullword integer**
> Length of pick data record array, in bytes, provided by the application for the graPHIGS API to return data record.

errind — **returned by the graPHIGS API, fullword integer**
  Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

  23 SPECIFIED WORKSTATION TYPE DOES NOT EXIST

  38 WORKSTATION HAS ONLY OUTPUT CAPABILITIES

  140 DEVICE NUMBER < ONE OR DEVICE NOT AVAILABLE

  509 DATA LENGTH VALUE < ZERO OR REQUIRED LENGTH

  533 INQUIRY DATA EXCEEDS AREA. OUTPUT TRUNCATED

  538 START VALUE < ONE

  539 REQUESTED NUMBER < ZERO

  543 START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

  548 SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

maxpath — **returned by the graPHIGS API, fullword integer**
  Maximum pick path depth.

necho — **returned by the graPHIGS API, fullword integer**
  Total number of available prompt/echo types.

echo — **returned by the graPHIGS API, array of fullword integers**
  List of available prompt/echo types. The output array must be large enough to contain the requested data.

area — **returned by the graPHIGS API, 6 short floating-point numbers (DC)**
  Default echo area (Xmin, Xmax, Ymin, Ymax, Zmin, Zmax).

datalen — **returned by the graPHIGS API, fullword integer**
  Default pick data record length, in bytes.

data — **returned by the graPHIGS API, variable length data**
  Default pick data record for the default prompt/echo type (`1=TYPE`).

GPQDS - Inquire Maximum Display Surface Size

GPQDS (*wstype, errind, units, csize, asize*)

Note: This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQDS** to inquire the maximum display surface size for the specified workstation type.

The graPHIGS API returns the maximum display surface sizes in Device Coordinates (DC) and address units.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype **— specified by user, 8-byte character string**
>   Workstation type.

errind **— returned by the graPHIGS API, fullword integer**
>   Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

>   **23**   SPECIFIED WORKSTATION TYPE DOES NOT EXIST

>   **35**   WORKSTATION HAS ONLY INPUT CAPABILITIES

>   **548**   SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

units **— returned by the graPHIGS API, fullword integer**
>   Device coordinate units (1=METERS, 2=OTHER).

csize **— returned by the graPHIGS API, 3 short floating-point numbers (DC)**
>   Maximum display surface size in *x*, *y*, and *z* directions.

asize **— returned by the graPHIGS API, 3 fullword integers**
>   Maximum display surface size in address units.

GPQDSK - Inquire Default Stroke Device Data

GPQDSK (*wstype*, *device*, *start*, *number*, *length*, *errind*, *dimen*, *size*, *necho*, *echo*, *area*, *buflen*, *editpos*, *datalen*, *data*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQDSK** to inquire the default values of the requested stroke device for the specified workstation type.

The graPHIGS API returns the default values for the requested stroke device. For more information on defaults, see *The graPHIGS Programming Interface: Technical Reference*.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 533 (an output parameter is not large enough for all the requested data), then the values up to the length specified are returned. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
Workstation type.

device — **specified by user, fullword integer**
Stroke device number.

start — **specified by user, fullword integer**
Starting member of the list of prompt/echo types (>=1).

number — **specified by user, fullword integer**
Number of prompt/echo types requested (>=0).

length — **specified by user, fullword integer**
Length of stroke data record array, in bytes, provided by application for the graPHIGS API to return data record (>=0).

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

GPQDST - Inquire Default String Device Data

> GPQDST (*wstype*, *device*, *start*, *number*, *length*, *errind*, *size*, *necho*, *echo*, *area*, *buflen*, *editpos*, *datalen*, *data*)

Note: This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQDST** to inquire the default values of the specified string device for the specified workstation type.

The graPHIGS API returns the default values for the requested string device. For more information on default values, see *The graPHIGS Programming Interface: Technical Reference*.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 533 (an output parameter is not large enough for all the requested data), then the values up to the length specified are returned. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
    Workstation type.

device — **specified by user, fullword integer**
    String device number.

start — **specified by user, fullword integer**
    Starting member of the list of prompt/echo types (>=1).

number — **specified by user, fullword integer**
    Number of prompt/echo types requested (>=0).

length — **specified by user, fullword integer**
    This refers to the length of the array provided by the application for the graPHIGS API to return the data record, in bytes.

errind — **returned by the graPHIGS API, fullword integer**
    Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

    23   SPECIFIED WORKSTATION TYPE DOES NOT EXIST

    38   WORKSTATION HAS ONLY OUTPUT CAPABILITIES

GPQDV - Inquire Deferral and Update State Values

> GPQDV (*wsid*, *errind*, *defer*, *modif*, *dissurf*, *dstat*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQDV** to inquire the current deferral and update state values for the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

errind — **returned by the graPHIGS API, fullword integer**
>   Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

>   **25**   SPECIFIED WORKSTATION DOES NOT EXIST

>   **35**   WORKSTATION HAS ONLY INPUT CAPABILITIES

defer — **returned by the graPHIGS API, fullword integer**
>   Deferral mode (`1=ASAP`, `2=BNIG`, `3=BNIL`, `4=ASTI`, `5=WAIT`).

modif — **returned by the graPHIGS API, fullword integer**
>   Modification mode (`1=NO_IMMEDIATE_VISUAL_EFFECT`, `2=UPDATE_WITHOUT_REGENERATION`, `3=QUICK_UPDATE`).

dissurf — **returned by the graPHIGS API, fullword integer**
>   Display surface empty (`1=NOT_EMPTY`, `2=IS_EMPTY`).

dstat — **returned by the graPHIGS API, fullword integer**
>   Display status (`1=CORRECT`, `2=DEFERRED`, `3=SIMULATED`).

GPQDVL - Inquire Default Valuator Device Data

> **GPQDVL (***wstype*, *device*, *start*, *number*, *length*, *errind*, *ivalue*, *necho*, *echo*, *area*, *lovalue*, *hivalue*, *datalen*, *data***)**

>   **Note:** This subroutine is a Workstation Description Table WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQDVL** to inquire the default values of the specified valuator device for the specified workstation type.

The graPHIGS API returns the default values for the requested valuator device. For more information on default values, see *The graPHIGS Programming Interface: Technical Reference*.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator indicates that an output parameter is not large enough for the requested data, then the values are available up to the length specified. If the error indicator is 533 (an output parameter is not large enough for all the requested data), then the values up to the length specified are returned. If the error indicator is 543 (the start value exceeds the extent of the available

data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
Workstation type.

device — **specified by user, fullword integer**
Valuator device number.

start — **specified by user, fullword integer**
Starting member of the list of prompt/echo types (>=1).

number — **specified by user, fullword integer**
Number of prompt/echo types requested (>=0).

length — **specified by user, fullword integer**
This refers to the length of the data array provided by the application for the graPHIGS API to return the data record, in bytes.

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

23	SPECIFIED WORKSTATION TYPE DOES NOT EXIST
38	WORKSTATION HAS ONLY OUTPUT CAPABILITIES
140	DEVICE NUMBER < ONE OR DEVICE NOT AVAILABLE
509	DATA LENGTH VALUE < ZERO OR REQUIRED LENGTH

543	START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED
548	SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

ivalue — **returned by the graPHIGS API, short floating-point number**
Default initial value.

necho — **returned by the graPHIGS API, fullword integer**
Total number of available prompt/echo types.

echo — **returned by the graPHIGS API, array of fullword integers**
List of available prompt/echo types. The output array must be large enough to contain the requested data.

area — **returned by the graPHIGS API, 6 short floating-point numbers (DC)**
Default echo area (Xmin, Xmax, Ymin, Ymax, Zmin, Zmax).

lovalue — **returned by the graPHIGS API, short floating-point number**
Default low end of range for valuator.

hivalue — **returned by the graPHIGS API, short floating-point number**
Default high end of range for valuator.

datalen — **returned by the graPHIGS API, fullword integer**
Default valuator data record length, in bytes.

data — **returned by the graPHIGS API, variable length data**
> Default valuator data record, in bytes for the default prompt/echo type (`1=TYPE`).

GPQED - Inquire List of Element Data

> GPQED (*number, buflen, errind, actnum, actlen, data, termcond*)

> **Note:** This subroutine is a Structure State List (SSL) inquiry. For an overview, see "SSL Inquiries."

Purpose

Use **GPQED** to inquire the contents of one or more sequential structure elements starting at the one pointed to by the current element pointer. The elements will be returned in the format that is described in *The graPHIGS Programming Interface: Technical Reference*.

This subroutine does not move the element pointer.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

> **Note:** The format of the element data that is returned by this subroutine is different from that returned by the Inquire Element Content (**GPQE**) subroutine.

Parameters

number — **specified by user, fullword integer**
> Number of elements to be returned (>=1).

buflen — **specified by user, fullword integer**
> Length, in bytes, of the data area specified by *data* into which the returned structure elements will be placed (>=0).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **4**   FUNCTION REQUIRES STATE STOP

535   CURRENT ELEMENT POINTER IS ZERO

539   REQUESTED NUMBER < ZERO

540   REQUESTED NUMBER < ONE

actnum **— returned by the graPHIGS API, fullword integer**
> Total number of elements that have been returned.

actlen **— returned by the graPHIGS API, fullword integer**
> Total length, in bytes, of the structure element data that has been returned in *data*.

data **— returned by the graPHIGS API, variable data**
> The data buffer into which the structure elements are to be returned.

> The structure elements are placed into this area so that the first structure element starts at the beginning of the area and each succeeding element can be reached by adding the length of the structure element to its offset into the buffer. Only complete structure elements will be returned. The format of each structure element is shown in *The graPHIGS Programming Interface: Technical Reference*.

termcond **— returned by the graPHIGS API, fullword integer**
> Termination condition. The list of structure elements was terminated due to one of the following reasons:

> **1-Count Exhausted**
> > The requested number of elements have been returned.

> **2-Buffer Overflow**
> > The requested number of elements could not be returned because they would not all fit in the area provided. *actnum* will contain the actual number returned.

> **3-End of Structure**
> > The last element of the structure was encountered. This condition supersedes the Count Exhausted condition (if that condition was in effect). Because of this, the total number of elements returned may or may not be equal to the requested number of elements to be returned so *actnum* should be checked to find the actual number of elements returned.

> **4-Big Element**
> > The next element to be returned would not fit into the inbound buffer between the nucleus and shell. *actnum* will contain the number of elements preceding the one that would not fit. This number of elements will be in *data* also.

GPQEDA - Inquire List of Element Data for any Structure

GPQEDA (*strid*, *start*, *number*, *buflen*, *errind*, *actnum*, *actlen*, *data*, *termcond*)

> **Note:** This subroutine is a Structure State List (SSL) inquiry. For an overview, see ″SSL Inquiries.″

Purpose

Use **GPQEDA** to inquire the contents of one or more sequential structure elements from a specified structure and element position. The elements will be returned in the format that is described in *The graPHIGS Programming Interface: Technical Reference*. If the specified element position is greater than the number of elements in the structure or is less than one then the error indicator will be non-zero.

If the inquired information is available, the error indicator is returned as zero, and the values are returned in the output parameters. If the inquired information is unavailable, the error indicator contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

> **Note:** The format of the element data that is returned by this subroutine is the same as that returned by the Inquire Element Data (**GPQED**) subroutine.

Parameters

strid — **specified by user, fullword integer**
> Structure identifier.

start — **specified by user, fullword integer**
> The position of the first element whose element data is to be returned (>=1).

number — **specified by user, fullword integer**
> Number of elements requested (>=1).

buflen — **specified by user, fullword integer**
> Length in bytes of the *data* parameter.

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

12	FUNCTION REQUIRES STATE SSSL
122	STRUCTURE IDENTIFIER DOES NOT EXIST
524	ELEMENT POSITION > NUMBER OF ELEMENTS IN STRUCTURE
538	START VALUE < ONE
540	REQUESTED NUMBER < ONE
577	BUFFER LENGTH IS < ZERO

actnum — **returned by the graPHIGS API, fullword integer**
> Total number of elements actually returned.

actlen — **returned by the graPHIGS API, fullword integer**
> Total length in bytes of the element data returned in the *data* parameter.

data — **returned by the graPHIGS API, variable data**
> The data buffer into which the structure elements are to be returned. The structure elements are placed into this area so that the first structure element starts at the beginning of the area and each succeeding element can be reached by adding the length of the structure element to its offset into

the buffer. Only complete structure elements will be returned. The format of each structure element is shown in *The graPHIGS Programming Interface: Technical Reference*.

termcond **— returned by the graPHIGS API, fullword integer**

> Termination condition. The list of structure elements was terminated due to one of the following reasons:

> **1- Count Exhausted**
>> The requested number of elements have been returned.

> **2- Buffer Overflow**
>> The requested number of elements could not be returned because they would not all fit in the area provided. *actnum* will contain the actual number returned.

> **3- End of Structure**
>> The last element of the structure was encountered. This condition supersedes the Count Exhausted condition (if that condition was in effect). Because of this, the total number of elements may or may not be equal to the requested number of elements to be returned so *actnum* should be checked to find the actual number of elements returned.

> **4- Big Element**

GPQEF - Inquire Edge Facilities

GPQEF (*wstype, start, number, errind, netype, eltype, nelwidth, elwidth, minelw, maxelw, npred*)

Note: This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQEF** to inquire the edge facilities for the specified workstation type.

The graPHIGS API returns a number indicating the total number of available line types and their identifiers (*netype*[default] the available number of line widths (*nelwidth*), and the nominal (*eltype*), minimum (*minelw*), and maximum values (*maxelw*) and the number of predefined edge indexes (*npred*). The graPHIGS API returns the width of lines in Device Coordinate (DC) units.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype **— specified by user, 8-byte character string**
     Workstation type.

start **— specified by user, fullword integer**
     Starting member of the list of line types of edges (>=1).

number **— specified by user, fullword integer**
     Number of line types of edges requested (>=0).

errind **— returned by the graPHIGS API, fullword integer**
     Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

     23   SPECIFIED WORKSTATION TYPE DOES NOT EXIST

     35   WORKSTATION HAS ONLY INPUT CAPABILITIES

538 START VALUE < ONE

539 REQUESTED NUMBER < ZERO

543 START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

548 SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

netype **— returned by the graPHIGS API, fullword integer**
Total number of available line types of edges.

eltype **— returned by the graPHIGS API, array of fullword integers.**
List of available edge line types in the workstation's available edge line type table. The table size and specific entries supported are workstation dependent. The default edge line type table for supported entries is defined with the following line types: (1=SOLID_LINE, 2=DASHED, 3=DOTTED, 4=DASH_DOT, 5=LONG_DASH, 6=DOUBLE_DOT, 7=DASH_DOUBLE_DOT, 8-n=SOLID_LINE). The output array must be large enough to contain the requested data.

nelwidth **— returned by the graPHIGS API, fullword integer**
Number of available line widths. (Zero means that the workstation supports a continuous range of line widths of edges.)

elwidth **— returned by the graPHIGS API, short floating-point number (DC)**
Nominal line width of edge.

minelw **— returned by the graPHIGS API, short floating-point number (DC)**
Minimum linewidth of edge.

maxelw **— returned by the graPHIGS API, short floating-point number (DC)**
Maximum linewidth of edge.

npred **— returned by the graPHIGS API, fullword integer**
Number of predefined edge bundle table entries.

GPQEHA - Inquire List of Element Headers for any Structure

GPQEHA (*strid*, *start*, *number*, *errind*, *actnum*, *header*)

Note: This subroutine is a Structure State List (SSL) inquiry. For an overview, see *"SSL Inquiries."*

Purpose

Use **GPQEHA** to inquire a list of element headers from a specified structure. This subroutine returns the list in sequential order starting from a specified element position.

- If the specified element position is greater than the number of elements in the structure, then the *errind* parameter will contain an error.
- If the specified element position is less than one, the *errind* parameter will contain an error.
- If the requested number is larger than the number of elements between the current element and the end of the structure, only information about the existing elements is returned and the actual number (*actnum*) parameter is set to the number of element codes.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

> **Note:** The format of the element headers that are returned by this subroutine is the same as that returned by the Inquire List of Element Headers (**GPQEHD**) subroutine.

Parameters

strid — **specified by user, fullword integer**
> Structure identifier.

start — **specified by user, fullword integer**
> The position of the first element whose header is to be returned (>=1).

number — **specified by user, fullword integer**
> Number of element headers requested (>=1).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

12	FUNCTION REQUIRES STATE SSSL
122	STRUCTURE IDENTIFIER DOES NOT EXIST
524	ELEMENT POSITION > NUMBER OF ELEMENTS IN STRUCTURE
538	START VALUE < ONE
540	REQUESTED NUMBER < ONE

actnum — **returned by the graPHIGS API, fullword integer**
> Number of element headers actually returned.

header — **returned by the graPHIGS API, fullword integer**
> A list of element headers. The first halfword of each element header contains the length of the element and the second halfword contains the element code. The information that corresponds to each element header and the list of element codes used by graPHIGS API can be found in *The graPHIGS Programming Interface: Technical Reference.*

GPQEHD - Inquire List of Element Headers

GPQEHD (*number, errind, actnum, header*)

> **Note:** This subroutine is a Structure State List (SSL) inquiry. For an overview, see ″SSL Inquiries.″

Purpose

Use **GPQEHD** to inquire a list of element headers from the current open structure. This subroutine returns the list in the sequential order starting from the current element pointer. If the requested number is larger than the number of elements between the current element and the end of the open structure, only information about the existing elements is returned and the actual number parameter is set to the number of actually returned element codes.

This subroutine does not move the element pointer.

If the inquired information is available, the error indicator is returned as zero, and the values are returned in the output parameters. If the inquired information is unavailable, the error indicator contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

> **Note:** The format of the element headers that is returned by this subroutine is different from the information that is returned by the older Inquire Element Type and Size (**GPQETS**) subroutine.

Parameters

number — **specified by user, fullword integer**
    Number of entries requested (>=1).

errind — **returned by the graPHIGS API, fullword integer**
    Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

    4   FUNCTION REQUIRES STATE STOP

    535   CURRENT ELEMENT POINTER IS ZERO

    540   REQUESTED NUMBER < ONE

actnum — **returned by the graPHIGS API, fullword integer**
    Number of entries actually returned.

header — **returned by the graPHIGS API, array of 2 halfword integers**
    List of element headers. The first and second halfword integer of each element header indicates the length and code of the structure element, respectively.

    The information that corresponds to each element and length and the list of element codes used by the graPHIGS API can be found in *The graPHIGS Programming Interface: Technical Reference*.

GPQEMS - Inquire Error Message

GPQEMS (*length*, *errind*, *number*, *message*)

> **Note:** This subroutine is a graPHIGS API State List (PSL) inquiry. For an overview, see ″PSL Inquiries.″

Purpose

Use **GPQEMS** to inquire the current error message. If an error was generated, the graPHIGS API returns the number of bytes in the error message and the error message text.

If the inquired information is available, the error indicator is returned as zero, and the values are returned in the output parameters. If the error indicator indicates that an output parameter is not large enough for the requested data, then the values will be available up to the length specified. If the inquired information is unavailable, the error indicator contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

length — **specified by user, fullword integer**
> Length of error message array in bytes provided by the application for the graPHIGS API to return message.

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **505**   LENGTH OF RETURN ARRAY < ZERO

> **521**   NOT IN ERROR STATE

number — **returned by the graPHIGS API, fullword integer**
> Total number of bytes in error message text.

message — **returned by the graPHIGS API, variable length character string**
> Message text.

GPQEP - Inquire Element Pointer

GPQEP (*errind*, *value*)

> **Note:** This subroutine is a Structure State List (SSL) inquiry. For an overview, see ″SSL Inquiries.″

Purpose

Use **GPQEP** to inquire the value of the current element pointer in the currently selected structure store.

A structure must be open to invoke this subroutine.

If the required information is available, the error indicator is returned as zero, and the value is returned in the output parameters. If a structure is not open, then the error indicator contains an error number indicating the reason, and the value returned in the output parameter is unpredictable.

Parameters

errind **— returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

4   FUNCTION REQUIRES STATE STOP

value **— returned by the graPHIGS API, fullword integer**
Current element pointer value.

GPQES - Inquire List of Available Escape Subroutines

GPQES (*wstype*, *start*, *number*, *errind*, *totnum*, *escid*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQES** to obtain a list of the escape function identifiers for the specified workstation type.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype **— specified by user, 8-byte character string**
Workstation type.

start **— specified by user, fullword integer**
Starting member in the list of escape subroutine identifiers (>=1).

number **— specified by user, fullword integer**
Total number of escape subroutine identifiers requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

23 SPECIFIED WORKSTATION TYPE DOES NOT EXIST

538 START VALUE < ONE

539 REQUESTED NUMBER < ZERO

543 START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

548 SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

totnum — **returned by the graPHIGS API, fullword integer**
Total number of available escape subroutine identifiers.

escid — **returned by the graPHIGS API, array of fullword integers**
List of available escape subroutine identifiers:
- 1001 - Sound Alarm
- 1002 - Enable/Disable Link Switch Notification
- 1003 - Plot Size
- 1004 - Initialize Pick Correlation State
- 1005 - Set Pick Selection Criteria

GPQEXS - Inquire Executed Structures

GPQEXS (*strid, start, number, errind, totnum, lstrid*)

Note: This subroutine is a Structure State List (SSL) inquiry. For an overview, see *"SSL Inquiries."*

Purpose

Use **GPQEXS** to inquire the list of structure identifiers that exist in execute structure-type elements (execute structure elements and conditional execute structure elements) within the specified structure of the currently selected structure store.

If the inquired information is available, the error indicator is returned as zero, and the values are returned in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total-number parameter is set. If the inquired information is unavailable, the error indicator contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

strid **— specified by user, fullword integer**
> Structure identifier.

start **— specified by user, fullword integer**
> Starting member of the list of structure identifier (>=1).

number **— specified by user, fullword integer**
> Number of entries requested (>=0).

errind **— returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **12**   FUNCTION REQUIRES STATE SSSL

> **122**   STRUCTURE IDENTIFIER DOES NOT EXIST

> **538**   START VALUE < ONE

> **539**   REQUESTED NUMBER < ZERO

> **543**   START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

totnum **— returned by the graPHIGS API, fullword integer**

GPQFAR - Inquire Font Aspect Ratios

GPQFAR (*csid*, *font*, *slength*, *string*, *errind*, *aspect-ratio-list*)

> **Note:** This subroutine is a graPHIGS API State List (PSL) inquiry. For an overview, see ″PSL Inquiries.″

Purpose

Use **GPQFAR** to inquire the font aspect ratios for the characters in a specified character string using the specified character set and font.

The list of returned ratios corresponds to the specified character set and font. Aspect ratios are specified as the ratio of the font's nominal width relative to the font's nominal height. The user requests the character set and font. The ratios are workstation independent.

If the inquired information is available, the error indicator is returned as zero, and the values are returned in the output parameter. If the inquired information is unavailable, the error indicator contains an error number indicating the reason, and the value returned in the output parameter is unpredictable.

Parameters

csid — **specified by user, fullword integer**
> Character set identifier.
>
> See Appendix A. ″Character Set and Font Identifiers″ for more information.

font — **specified by user, fullword integer**
> Font identifier (>=1).

slength — **specified by user, fullword integer**
> Length of the specified text string in bytes (>=0).

string — **specified by user, variable length character string**
> Character string for which aspect ratios are requested.

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:
>
> | | |
> | --- | --- |
> | **75** | TEXT FONT VALUE IS INVALID |
> | **108** | NUMBER OF CHARACTERS IN TEXT STRING < ZERO |
> | **542** | CHARACTER SET IDENTIFIER IS INVALID |
> | **560** | CHARACTER SET/FONT COMBINATION IS NOT AVAILABLE |
> | **564** | TEXT STRING CONTAINS AN UNSUPPORTED CHARACTER CODE |

aspect-ratio-list — **returned by the graPHIGS API, array of short floating-point numbers**
> List of corresponding aspect ratios of the requested text string for the specified character set and font. The array must be large enough to hold the required data.

GPQFBC - Inquire Frame Buffer Characteristics

GPQFBC (*wstype, errind, org, n, depth*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQFBC** to inquire frame buffer characteristics for the specified workstation.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
> Workstation type.

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **23**   SPECIFIED WORKSTATION TYPE DOES NOT EXIST

> **35**   WORKSTATION HAS ONLY INPUT CAPABILITIES

> **548**   SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

org — **returned by the graPHIGS API, fullword integer**
> Frame buffer organization (1=COMPONENT, 2=INDEXED).

n — **returned by the graPHIGS API, fullword integer**
> Number of frame buffer components (>=0).

depth — **returned by the graPHIGS API, array of fullword integers**
> List of bit depths for frame buffer components. For this parameter, the application must supply an array large enough to contain the maximum entries which may be returned. A component frame buffer has three components. An indexed frame buffer has one component.

GPQFCH - Inquire Font Characteristics

GPQFCH (*csid*, *font*, *errind*, *proportional*, *top*, *bottom*, *nomaspect*)

> **Note:** This subroutine is a graPHIGS API State List (PSL) inquiry. For an overview, see "PSL Inquiries."

Purpose

Use **GPQFCH** to inquire the font characteristics for the requested character set and font.

The graPHIGS API returns data indicating the top and bottom of the character cell offset from the cap line respectively, the nominal aspect ratio relative to the character's height, and if the font is fixed or proportionally sized. For more information, see *The graPHIGS Programming Interface: Understanding Concepts*.

If the inquired information is available, the error indicator is returned as zero, and the value is returned in the output parameter. If the inquired information is unavailable, the error indicator contains an error number indicating the reason, and the value returned in the output parameter is unpredictable.

Annotation text capabilities are defined in terms of the following character box description:

```
    <----- width ------->

    --------------------- <---top line
   |                     |
   |                     |
    | - - - - - - - - - -| <---cap line
   |                    ^
   |                    |  height
   |                    |
   |                    |
   |                    v
    | - - - - - - - - - | <---base line
   |                     |
    --------------------- <---bottom line
```
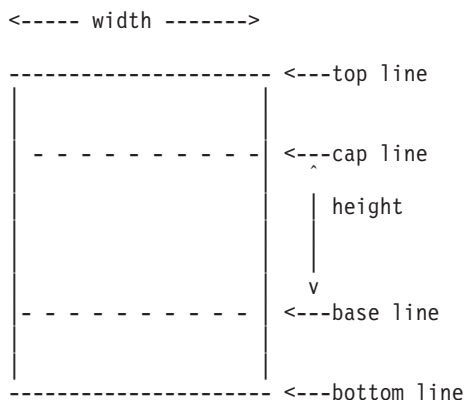

Height is defined as the distance between the base line and the cap line.

> **Note:** The definition of height is different from that used by the Inquire Annotation Font Characteristics (**GPQAFC**) subroutine.

Parameters

csid **— specified by user, fullword integer**
    Character set identifier.

    See Appendix A. "Character Set and Font Identifiers" for more information.

font — **specified by user, fullword integer**
Font identifier (>=1).

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

75 TEXT FONT VALUE IS INVALID

542 CHARACTER SET IDENTIFIER IS INVALID

560 CHARACTER SET/FONT COMBINATION IS NOT AVAILABLE

proportional — **returned by the graPHIGS API, fullword integer**
Font is defined as fixed or proportionally sized (1=FIXED, 2=PROPORTIONAL).

top — **returned by the graPHIGS API, short floating-point number**
Top offset from the cap line in the character cell specified as a fraction of the character's height.

bottom — **returned by the graPHIGS API, short floating-point number**
Bottom offset from the base line in the character cell specified as a fraction of the character's height.

nomaspect — **returned by the graPHIGS API, short floating-point number**
The font nominal aspect ratio.

This is the nominal width to height ratio.

GPQFO - Inquire Active Fonts

GPQFO (*wsid*, *start*, *number*, *errind*, *nfont*, *lcsid*, *lfont*)

Note: This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQFO** to inquire the currently active geometric character set and font identifiers, that is, the geometric font pool contents, for the specified workstation.

The graPHIGS API returns data indicating the total quantity of active geometric fonts and their character set and font identifiers.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the

available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
 Workstation identifier.

start — **specified by user, fullword integer**
 Starting member of the list of active fonts (>=1).

number — **specified by user, fullword integer**
 Number of active fonts requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
 Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

 25 SPECIFIED WORKSTATION DOES NOT EXIST

 538 START VALUE < ONE

 539 REQUESTED NUMBER < ZERO

 543 START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

nfont — **returned by the graPHIGS API, fullword integer**
 Total number of active geometric fonts.

lcsid — **returned by the graPHIGS API, array of fullword integers.**
 List of active geometric character set identifiers. The output array must be large enough to contain the requested data.

 See Appendix A. ″Character Set and Font Identifiers″ for more information.

lfont — **returned by the graPHIGS API, array of fullword integers.**
 List of active geometric fonts. The output array must be large enough to contain the requested data.

 Note: Entry *x* of the *lcsid* list and entry *x* of the *lfont* list combine to describe entry *x* of the active geometric font pool on the specified workstation.

GPQFP - Inquire Font Pool Size

GPQFP (*wstype*, *errind*, *poolsize*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQFP** to inquire the maximum font pool size for the specified workstation type.

The graPHIGS API returns data indicating the maximum number of simultaneously active fonts for the specified workstation type.

Parameters

wstype — **specified by user, 8-byte character string**
> Workstation type.

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **23**   SPECIFIED WORKSTATION TYPE DOES NOT EXIST

> **35**   WORKSTATION HAS ONLY INPUT CAPABILITIES

> **548**   SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

poolsize — **returned by the graPHIGS API, fullword integer**
> Maximum font pool size from the workstation description table.

GPQGD - Inquire List of Generalized Drawing Primitives

GPQGD (*wstype*, *start*, *number*, *errind*, *totnum*, *gdpid*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQGD** to inquire the available Generalized Drawing Primitives (GDPs) for the specified workstation type.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype **— specified by user, 8-byte character string**
>   Workstation type.

start **— specified by user, fullword integer**
>   Starting member of the list of GDP identifiers (>=1).

number **— specified by user, fullword integer**
>   Number of GDP identifiers requested (>=0).

errind **— returned by the graPHIGS API, fullword integer**
>   Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

GPQGDP - Inquire Generalized Drawing Primitive

GPQGDP (*wstype*, *gdpid*, *errind*, *number*, *list*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQGDP** to inquire the list of attributes used by the specified Generalized Drawing Primitive (GDP) for the specified workstation type.

The graPHIGS API returns a list of the attributes used by the specified GDP.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
      Workstation type.

gdpid — **specified by user, fullword integer**

List of GDP identifiers. One of the following GDP identifiers listed may be specified:

- 1001 - Pixel 3
- 1002 - Pixel 2
- 1003 - Disjoint Polyline 3
- 1004 - Disjoint Polyline 2
- 1005 - Circle 2
- 1006 - Circular Arc 2
- 1007 - Ellipse 2
- 1008 - Ellipse 3
- 1009 - Elliptical Arc 2

- 1033 - Non-Uniform B-Spline Curve 3
- 1034 - Non-Uniform B-Spline Curve 2
- 1035 - Non-Uniform B-Spline Surface
- 1036 - Trimmed Non-Uniform B-Spline Surface
- 1037 - Polyhedron Edge
- 1039 - Character Line 2
- 1046 - Polysphere

errind — **returned by the graPHIGS API, fullword integer**

Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

23   SPECIFIED WORKSTATION TYPE DOES NOT EXIST

35   WORKSTATION HAS ONLY INPUT CAPABILITIES

41   WORKSTATION TYPE CANNOT GENERATE SPECIFIED GDP

548   SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

number — **returned by the graPHIGS API, fullword integer**

Number of sets of attributes used.

list — **returned by the graPHIGS API, 5 fullword integers**

List of sets of attributes used by the specified GDP (`1=POLYLINE, 2=POLYMARKER, 3=TEXT, 4=INTERIOR, 5=EDGE`).

GPQGFC - Inquire Geometric Font Characteristics

GPQGFC (*wsid*, *csid*, *font*, *start*, *num*, *errind*, *prec*, *nhts*, *lhts*, *lnfac*, *lmnfac*, *lmxfac*)

>**Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQGFC** to inquire the geometric text capabilities for the specified character set and font on the specified workstation.

This information consists of the highest text precision for this *csid*/*font* that is supported by the specified workstation (*prec*), the number of supported character heights (*nhts*), a list of the exact supported character heights (*lhts*), and the number of character expansion factors (*lnfac*), minimum expansion factor (*lmnfac*), and maximum expansion factor (*lmxfac*) corresponding to each supported character height.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
>Workstation identifier.

csid — **specified by user, fullword integer**
>Character set identifier.

>See Appendix A. ″Character Set and Font Identifiers″ for more information.

font — **specified by user, fullword integer**
>Font identifier (>=1).

start — **specified by user, fullword integer**
>Starting member of the list of supported heights (>=1).

num — **specified by user, fullword integer**
>Number of list elements requested (>=0).

>>**Note:** The four output arrays must be large enough to hold the requested number of elements.

errind — **returned by the graPHIGS API, fullword integer**
>Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
75	TEXT FONT VALUE IS INVALID
538	START VALUE < ONE
539	REQUESTED NUMBER < ZERO
542	CHARACTER SET IDENTIFIER IS INVALID
543	START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED
561	CHARACTER SET/FONT COMBINATION IS NOT ACTIVE
563	CHARACTER SET/FONT COMBINATION IS NOT AVAILABLE FOR GEOMETRIC TEXT

prec **— returned by the graPHIGS API, fullword integer**
Highest available precision for the corresponding *csid*/*font* (1=STRING_PREC, 2=CHAR_PREC, 3=STROKE_PREC).

> **Note:** If the highest precision supported is 3=STROKE_PREC, then the parameters that follow refer to the geometric text capabilities in character precision.

nhts **— returned by the graPHIGS API, fullword integer**
Total number of available character heights supported for the specified character set and font on the specified workstation.

A value of zero means that a continuous range of heights is supported. The lists describe the minimum and maximum character heights.

lhts **— returned by the graPHIGS API, array of short floating-point numbers (DC)**
List of all character heights supported on this workstation for geometric text in Device Coordinates (DC).

For a continuous range of character heights, this list contains the minimum and maximum character heights.

lnfac **— returned by the graPHIGS API, array of fullword integers**
List of the total number of available character expansion factors. Each element in the list corresponds to an element in the list of character heights.

A value of zero means that the workstation supports a continuous range of character expansion factors.

lmnfac **— returned by the graPHIGS API, array of short floating-point numbers**
List of the minimum character expansion factors supported. There is one list entry for each entry in the list of supported heights.

lmxfac **— returned by the graPHIGS API, array of short floating-point numbers**
List of the maximum character expansion factors supported. There is one list entry for each entry in the list of supported heights.

GPQGSE - Inquire List of Available GSEs

GPQGSE (*wstype*, *start*, *number*, *errind*, *totnum*, *gseid*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQGSE** to inquire a list of GSE identifiers available for the specified workstation type.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
> Workstation type.

start — **specified by user, fullword integer**
> Starting member of the list of GSEs (>=1).

number — **specified by user, fullword integer**
> Number of GSE identifiers requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> | | |
> |---|---|
> | **23** | SPECIFIED WORKSTATION TYPE DOES NOT EXIST |
> | **35** | WORKSTATION HAS ONLY INPUT CAPABILITIES |

GPQHF - Inquire Hatch Facilities

GPQHF (*wstype, errind, format, maxlen, npred, available*)

>   **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQHF** to inquire the hatch facilities for the specified workstation type.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the output parameter *available*, is set to 1, then the values returned in the other output parameters are unpredictable. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
>   Workstation type.

errind — **returned by the graPHIGS API, fullword integer**
>   Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

GPQHLF - Inquire Highlighting Filter

GPQHLF (*wsid*, *inlen*, *exlen*, *errind*, *inclen*, *incl*, *exclen*, *excl*)

Note: This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQHLF** to inquire the current highlighting inclusion and exclusion filters on the specified workstation.

The graPHIGS API returns the size of the inclusion filter and its contents and the size of the exclusion filter and its contents.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 533 (an output parameter is not large enough for all the requested data), then the values up to the length specified are returned. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

inlen — **specified by user, fullword integer**
Size of inclusion filter output array, specified in fullword integers (>=0).

This is the size of the array provided by the application for the graPHIGS API to return the corresponding data.

exlen — **specified by user, fullword integer**
Size of exclusion filter output array, specified in fullword integers (>=0).

This is the size of the array provided by the application for the graPHIGS API to return the corresponding data.

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
505	LENGTH OF RETURN ARRAY < ZERO
533	INQUIRY DATA EXCEEDS AREA. OUTPUT TRUNCATED

inclen — **returned by the graPHIGS API, fullword integer**
Returned inclusion filter size.

incl — **returned by the graPHIGS API, array of fullword integers.**
Inclusion filter. List of class names.

exclen — **returned by the graPHIGS API, fullword integer**

GPQHMO (*wstype*, *start*, *number*, *errind*, *totnum*, *mode*)

Note: This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQHMO** to inquire the hidden line hidden surface removal (HLHSR) facilities for the specified workstation.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype **— specified by user, 8-byte character string**
>   Workstation type.

start **— specified by user, fullword integer**
>   Starting member of the list of available HLHSR modes (>=1).

number **— specified by user, fullword integer**
>   Number of HLHSR modes requested (>=0).

errind **— returned by the graPHIGS API, fullword integer**
>   Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> | | |
> |---|---|
> | **23** | SPECIFIED WORKSTATION TYPE DOES NOT EXIST |

GPQHR - Inquire Hatch Representation

GPQHR (*wsid*, *index*, *errind*, *format*, *length*, *data*)

Note: This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQHR** to inquire the current hatch pattern in the specified entry of the workstation's hatch table.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

index — **specified by user, fullword integer**
Hatch table index (>=1).

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **25** SPECIFIED WORKSTATION DOES NOT EXIST
>
> **35** WORKSTATION HAS ONLY INPUT CAPABILITIES
>
> **84** INTERIOR STYLE INDEX VALUE < ONE
>
> **274** THIS FUNCTION IS NOT SUPPORTED BY THE WORKSTATION

format — **returned by the graPHIGS API, fullword integer**
Hatch pattern format (`1=BIT_ARRAY`).

length — **returned by the graPHIGS API, fullword integer**
Length of the hatch pattern definition.

data — **returned by the graPHIGS API, variable length data**
Hatch pattern definition data. Values returned to this parameter depend on the hatch pattern format. The application must supply storage for this parameter that is large enough to contain the maximum data that the specified workstation supports (see the Inquire Hatch Facilities [**GPQHF**] [page GPQHF - Inquire Hatch Facilities]) subroutine.

> **1=BIT ARRAY**

```
        -----------------
    0  |         x-size  |  fullword integer (number of columns)

GPQIBC - Inquire Image Board Characteristics

GPQIBC (*ibid*, *errind*, *depth*, *h*, *v*)

> **Note:** This subroutine is a graPHIGS API State List (PSL) inquiry. For an overview, see ″PSL Inquiries.″

Purpose

Use **GPQIBC** to inquire the image board characteristics for the specified image board: the image board was created by the Create Image Board (**GPCRIB**)subroutine.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

ibid **— specified by user, fullword integer**
Image board identifier.

errind **— returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

232 SPECIFIED IMAGE BOARD DOES NOT EXIST

depth **— returned by the graPHIGS API, fullword integer**
Bit depth of the image board.

h **— returned by the graPHIGS API, fullword integer**
Horizontal size of the image board.

v **— returned by the graPHIGS API, fullword integer**
Vertical size of the image board.

GPQIBF - Inquire Image Board Facilities

GPQIBF (*ncid*, *start*, *number*, *errind*, *totnum*, *depth*, *h*, *v*)

>**Note:** This subroutine is a Nucleus Description Table (NDT) inquiry. For an overview, see ″NDT Inquiries.″

Purpose

Use **GPQIBF** to inquire the image board capabilities for the specified nucleus.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

ncid — **specified by user, fullword integer**
>Nucleus identifier.

start — **specified by user, fullword integer**
>Starting member in the list of available image board bit depth (>=1).

number — **specified by user, fullword integer**
>Number of image board bit depth entries requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
>Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

202	SPECIFIED NUCLEUS DOES NOT EXIST
538	START VALUE < ONE
539	REQUESTED NUMBER < ZERO
543	START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

totnum — **returned by the graPHIGS API, fullword integer**
>Total number of available image board bit depths.

depth — **returned by the graPHIGS API, array of fullword integers**
>List of available image board bit depths.

h — **returned by the graPHIGS API, fullword integer**
>   Maximum horizontal size of an image board. (A value of zero means that there is no limit on the image board size.)

v — **returned by the graPHIGS API, fullword integer**
>   Maximum vertical size of an image board. (A value of zero means that there is no limit on the image board size.)

GPQICH - Inquire Image Characteristics

> **GPQICH (*wsid*, *index*, *errind*, *conn*, *ctid*, *totnum*, *libid*)**

>   **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see "WSL Inquiries."

Purpose

Use **GPQICH** to inquire the current image characteristics of the specified image on the specified workstation. The specified image was created by the Define Image (**GPDFI**) subroutine. Its characteristics consist of the image boards and color tables that are grouped together to form the specified image.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

The list of image board identifiers parameter (*libid*) must have a length of at least three fullwords.

Parameters

wsid — **specified by user, fullword integer**
>   Workstation identifier.

index — **specified by user, fullword integer**
>   Defined image index (>=1).

errind — **returned by the graPHIGS API, fullword integer**
>   Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

>   **25**   SPECIFIED WORKSTATION DOES NOT EXIST

35	WORKSTATION HAS ONLY INPUT CAPABILITIES
216	ONE OR MORE RESOURCES IS NOT ATTACHED
290	SPECIFIED IMAGE INDEX IS NOT DEFINED

conn — **returned by the graPHIGS API, fullword integer**
> Connection type (-1=FRAME_BUFFER_COMPATIBLE, 1=COMPONENT, 2=INDEXED).

ctid — **returned by the graPHIGS API, fullword integer**
> Color table identifier of the color table used to form the specified image.

totnum — **returned by the graPHIGS API, fullword integer**
> Number of image boards grouped together to form the specified image.

libid — **returned by the graPHIGS API, array of fullword integers**
> List of image board identifiers that form the specified image.

> The application must supply storage that is large enough to contain the maximum number of image board identifiers that the workstation supports. (Currently, three. However, in the future, this number may increase. Therefore, it is recommended that storage be supplied for *at least* 24 image board identifiers.)

GPQICS - Inquire Input Character Set

GPQICS (*wsid*, *class*, *device*, *errind*, *csid*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQICS** to inquire the current input character set for the specified input device on the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
   Workstation identifier.

class — **specified by user, fullword integer**
   Device class (`1=LOCATOR, 2=STROKE, 3=VALUATOR, 4=CHOICE, 5=PICK, 6=STRING`).

device — **specified by user, fullword integer**
   Device number.

errind — **returned by the graPHIGS API, fullword integer**
   Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

25	SPECIFIED WORKSTATION DOES NOT EXIST
38	WORKSTATION HAS ONLY OUTPUT CAPABILITIES
140	DEVICE NUMBER < ONE OR DEVICE NOT AVAILABLE
328	INPUT CLASS VALUE IS INVALID

csid — **returned by the graPHIGS API, fullword integer**
   Character set identifier.

   See Appendix A. ″Character Set and Font Identifiers″ for more information.

GPQID - Inquire Input Device State

GPQID (*wsid*, *class*, *device*, *errind*, *state*, *deact*, *echosw*, *trigger*, *break*, *reset*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQID** to inquire the current operating mode of the specified logical input device.

The operating mode consists of six individual switches. With the Set Input Device Mode (**GPIDMO**)subroutine, your application can set each of these switches individually to a specified value. This subroutine returns the current value for each of the switches.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid **— specified by user, fullword integer**
Workstation identifier.

class **— specified by user, fullword integer**
Input device class (`1=LOCATOR, 2=STROKE, 3=VALUATOR, 4=CHOICE, 5=PICK, 6=STRING`).

device **— specified by user, fullword integer**
Logical input device number (>=1).

errind **— returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

25	SPECIFIED WORKSTATION DOES NOT EXIST
37	WORKSTATION IS NOT OF CATEGORY OUTIN
38	WORKSTATION HAS ONLY OUTPUT CAPABILITIES
140	DEVICE NUMBER < ONE OR DEVICE NOT AVAILABLE
328	INPUT CLASS VALUE IS INVALID

state **— returned by the graPHIGS API, fullword integer**
State switch (`1=DEVICE_INACTIVE, 2=DEVICE_ACTIVE`).

deact **— returned by the graPHIGS API, fullword integer**
Auto deactivate switch (`1=OFF, 2=ON`).

echosw **— returned by the graPHIGS API, fullword integer**
Current echo switch (`1=NOECHO, 2=ECHO`).

trigger **— returned by the graPHIGS API, fullword integer**
Primary trigger switch (`1=OFF, 2=ON`).

break **— returned by the graPHIGS API, fullword integer**
Break switch (`1=OFF, 2=ON`).

reset **— returned by the graPHIGS API, fullword integer**
Auto reset switch (`1=OFF, 2=ON`).

GPQIDD - Inquire Input Device Description

GPQIDD (***wstype**, **class**, **devnum**, **id**, **lidata**, **idata**, **mlodata**, **errind**, **lodata**, **odata***)

Note: This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQIDD** to inquire the information about the specified device.

The group identifier (*id*) parameter identifies the data the graPHIGS API returns. Some data types may require additional information in the input data (*idata*) parameter.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 533 (an output parameter is not large enough for all the requested data), then the values up to the length specified are returned. If the information you inquired is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype **— specified by user, 8-byte character string**
   Workstation type.

class **— specified by user, fullword integer**
   Input device class (1=LOCATOR, 2=STROKE, 3=VALUATOR, 4=CHOICE, 5=PICK, 6=STRING).

devnum **— specified by user, fullword integer**
   Device number (>=1).

id **— specified by user, fullword integer**
   Group identifier. The graPHIGS API supports the following identifiers:

   Group identifier 1
      Available pick selection criteria. The device class must be set to a value of 5=PICK. No input data is required for this identifier.

lidata **— specified by user, fullword integer**
   Length, in bytes, of the input data area (>=0).

idata **— variable length data**
   Input data. Depending on the *id* parameter value specified, input data is as follows:

   If Group Identifier=1 (available pick selection criteria)
      No input data is required for this identifier.

mlodata **— specified by user, fullword integer**
   Length, in bytes, of the output data area (>=0).

errind **— returned by the graPHIGS API, fullword integer**
   Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

   23   SPECIFIED WORKSTATION TYPE DOES NOT EXIST

   38   WORKSTATION HAS ONLY OUTPUT CAPABILITIES

   140   DEVICE NUMBER < ONE OR DEVICE NOT AVAILABLE

   272   GROUP IDENTIFIER IS INVALID

   328   INPUT CLASS VALUE IS INVALID

   509   DATA LENGTH VALUE < ZERO OR REQUIRED LENGTH

533 INQUIRY DATA EXCEEDS AREA. OUTPUT TRUNCATED

548 SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

lodata **— returned by the graPHIGS API, fullword integer**
> Length, in bytes, of the available output data.

odata **— returned by the graPHIGS API, variable length data**
> Output data. Depending on the specified value of the *id* parameter, output data is as follows:

> **Group Identifier=1 (available pick selection criteria)**
> > Array of fullword integers.

> > The available pick selection criteria. The *lodata* parameter specifies the length of the array in bytes (1=FIRST, 2=LAST, 3=ALL, 4=FIRST_VISIBLE, 5=LAST_VISIBLE, 6=ALL_VISIBLE).

GPQIDF - Inquire Image Definition Facilities

GPQIDF (*wstype*, *start*, *number*, *errind*, *nimage*, *totnum*, *conn*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQIDF** to inquire the image definition facilities for the specified workstation.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype **— specified by user, 8-byte character string**
> Workstation type.

start **— specified by user, fullword integer**
> Starting member of the list of available connection types (>=1).

number **— specified by user, fullword integer**
>   Number of connection types entries requested (>=0).

errind **— returned by the graPHIGS API, fullword integer**
>   Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> | | |
> |---|---|
> | **23** | SPECIFIED WORKSTATION TYPE DOES NOT EXIST |

GPQIF - Inquire Interior Facilities

GPQIF (*wstype*, *starti*, *numi*, *starth*, *numh*, *errind*, *intnum*, *interiors*, *hatnum*, *hatch*, *npred*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQIF** to inquire the interior facilities for the specified workstation type.

The graPHIGS API returns data indicating the total number of available interior styles (*intnum*), the number of available hatch styles (*hatnum*), and the total number of indexes predefined in the interior bundle table (*npred*).

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype **— specified by user, 8-byte character string**
Workstation type.

starti **— specified by user, fullword integer**
Starting member of the list of interior styles (>=1).

numi **— specified by user, fullword integer**
Number of interior styles requested (>=0).

starth **— specified by user, fullword integer**
Starting member of the list of hatch styles (>=1).

numh **— specified by user, fullword integer**
Number of hatch styles requested (>=0).

errind **— returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

23	SPECIFIED WORKSTATION TYPE DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
538	START VALUE < ONE
539	REQUESTED NUMBER < ZERO
543	START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED
548	SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

intnum **— returned by the graPHIGS API, fullword integer**
Total number of available interior styles.

interiors **— returned by the graPHIGS API, array of fullword integers**
List of available interior styles (1=HOLLOW, 2=SOLID, 3=PATTERN, 4=HATCH, 5=EMPTY). The output array must be large enough to contain the requested data.

hatnum **— returned by the graPHIGS API, fullword integer**
Total number of available hatch styles.

hatch **— returned by the graPHIGS API, array of fullword integers**
List of available hatch styles. The output array must be large enough to contain the requested data.

npred **— returned by the graPHIGS API, fullword integer**
Number of predefined interior bundle table entries.

GPQIMC - Inquire Image Mapping Characteristics

GPQIMC (*wsid*, *imid*, *errind*, *view*, *index*, *origin*, *size*, *P*, *Q*, *R*, *method*, *priority*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see "WSL Inquiries."

Purpose

Use **GPQIMC** to inquire the current image mapping characteristics of the specified mapped image.

A defined image is displayed by mapping its rectangular part into a parallelogram in World Coordinates (WC). The mapped image is identified by an image mapping identifier.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
      Workstation identifier.

imid — **specified by user, fullword integer**
      Image mapping identifier.

errind — **returned by the graPHIGS API, fullword integer**
      Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

      25   SPECIFIED WORKSTATION DOES NOT EXIST

      35   WORKSTATION HAS ONLY INPUT CAPABILITIES

      296   SPECIFIED IMAGE MAPPING DOES NOT EXIST

view — **returned by the graPHIGS API, fullword integer**
      View index.

index — **returned by the graPHIGS API, fullword integer**
      Image index.

origin — **returned by the graPHIGS API, two fullword integers**
      Image rectangle origin.

size — **returned by the graPHIGS API, two fullword integers**
      Image rectangle size.

P — **returned by the graPHIGS API, three floating-point numbers (WC)**
      Lower left corner of the image mapping.

Q — **returned by the graPHIGS API, three floating-point numbers (WC)**
  Lower right corner of the image mapping.

R — **returned by the graPHIGS API, three floating-point numbers (WC)**
  Upper left corner of the image mapping.

method — **returned by the graPHIGS API, fullword integer**
  Image mapping method (`1=PIXEL_BY_PIXEL`).

priority — **returned by the graPHIGS API, short floating-point number**
  Priority.

GPQIMW - Inquire Image Mapping on Workstation

GPQIMW (*wsid*, *start*, *number*, *errind*, *totnum*, *limid*)

>   **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQIMW** to inquire the current image mappings for the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
>   Workstation identifier.

start — **specified by user, fullword integer**
>   Starting member of the list of defined image mappings (>=1).

number — **specified by user, fullword integer**
>   Number of image mappings requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**

Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

25 SPECIFIED WORKSTATION DOES NOT EXIST

35 WORKSTATION HAS ONLY INPUT CAPABILITIES

538 START VALUE < ONE

539 REQUESTED NUMBER < ZERO

543 START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

totnum — **returned by the graPHIGS API, fullword integer**

Total number of image mappings on the workstation.

limid — **returned by the graPHIGS API, array of fullword integers**

List of image mapping identifiers on the workstation.

GPQIQO - Inquire Input Queue Overflow

GPQIQO (*errind*, *major*, *class*, *minor*)

Note: This subroutine is a graPHIGS API State List (PSL) inquiry. For an overview, see ″PSL Inquiries.″

Purpose

Use **GPQIQO** to inquire identification of the event report causing the event queue overflow.

Once the event queue overflow occurs, no more events are added to the event queue until the overflow situation is cleared. The overflow situation is cleared when the event queue becomes empty. The application can make the event queue empty by using the Await Event (**GPAWEV**) subroutine, Flush Device Events (**GPFLEV**) subroutine, or the Flush Workstation Event (**GPFWEV**) subroutine.

If the event queue has overflowed since you last called the Open graPHIGS (**GPOPPH**) subroutine, the event class, major and minor codes of the event causing the overflow are returned (if the event class has corresponding major and minor codes).

The details of the possible event classes and meanings of their major and minor codes are shown in *The graPHIGS Programming Interface: Technical Reference*.

The event queue overflow is not reported to the application when the overflow occurs. It is reported on the next invocation of the following subroutines which may change the contents of the event queue.
- Await Event (**GPAWEV**) subroutine
- Flush Device Events (**GPFLEV**) subroutine
- Flush Workstation Events (**GPFWEV**)subroutine
- Detach Resource (**GPDTR**) subroutine (for a workstation)
- Close Workstation (**GPCLWS**) subroutine
- Disconnect Nucleus (**GPDNC**) subroutine(owning at least one workstation)

The event queue overflow is reported to the application only once per event queue overflow situation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **148** EVENT QUEUE HAS NOT OVERFLOWED

major — **returned by the graPHIGS API, fullword integer**
> Major event code.

class — **returned by the graPHIGS API, fullword integer**
> Event class.

minor — **returned by the graPHIGS API, fullword integer**
> Minor event code.

GPQISF - Inquire Input Character Set Facilities

GPQISF (*wstype*, *class*, *device*, *start*, *number*, *errind*, *ncsid*, *csid*)

Note: This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQISF** to inquire the character set identifiers that are supported for the specified input device on the specified workstation type.

The graPHIGS API returns data indicating the total number of available character sets and their character set identifiers.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
    Workstation type.

class — **specified by user, fullword integer**
    Device class (1=LOCATOR, 2=STROKE, 3=VALUATOR, 4=CHOICE, 5=PICK, 6=STRING).

device — **specified by user, fullword integer**
    Device number.

start — **specified by user, fullword integer**
    Starting member of the list of character set identifiers (>=1).

number — **specified by user, fullword integer**
    Number of character set identifiers requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
    Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **23**   SPECIFIED WORKSTATION TYPE DOES NOT EXIST
>
> **38**   WORKSTATION HAS ONLY OUTPUT CAPABILITIES
>
> **140**   DEVICE NUMBER < ONE OR DEVICE NOT AVAILABLE
>
> **328**   INPUT CLASS VALUE IS INVALID
>
> **538**   START VALUE < ONE
>
> **539**   REQUESTED NUMBER < ZERO
>
> **543**   START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED
>
> **548**   SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

ncsid — **returned by the graPHIGS API, fullword integer**
    Total number of character set identifiers supported.

csid — **returned by the graPHIGS API, array of fullword integers**
    List of supported character set identifiers.

    See Appendix A. ″Character Set and Font Identifiers″ for more information.

The output array must be large enough to contain the requested data.

GPQISN - Inquire Identifiers of Structures in Network

GPQISN (*strid*, *start*, *number*, *errind*, *totnum*, *istrid*)

Note: This subroutine is a Structure State List (SSL) inquiry. For an overview, see ″SSL Inquiries.″

Purpose

Use **GPQISN** to inquire a list of the structure identifiers in the specified structure network.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

strid — **specified by user, fullword integer**
Structure identifier of the root structure.

start — **specified by user, fullword integer**
The starting member of the list of structure identifiers (>=1).

number — **specified by user, fullword integer**
Number of entries requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

12	FUNCTION REQUIRES STATE SSSL
122	STRUCTURE IDENTIFIER DOES NOT EXIST
538	START VALUE < ONE
539	REQUESTED NUMBER < ZERO
543	START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

totnum — **returned by the graPHIGS API, fullword integer**
Total number of structures in network.

istrid — **returned by the graPHIGS API, array of fullword integers**
> List of conflicting structure identifiers. In a complete list of structure identifiers in the network, the first structure identifier entry is always the root structure. No structure identifiers are duplicated in the list (e.g., if a structure is referenced in the network more than once, then it only appears once in the list).

GPQIT - Inquire Input Trigger Capabilities

GPQIT (*wstype*, *class*, *devnum*, *start*, *number*, *errind*, *ntrigs*, *ltrigs*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQIT** to inquire the input device trigger capabilities of a specified device for a specified workstation type. If the triggers are programmable, the graPHIGS API returns a list of available triggers. The returned list corresponds to the available triggers for all trigger levels of the specified input device.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
> Workstation identifier.

class — **specified by user, fullword integer**
> Input device class (1=LOCATOR, 2=STROKE, 3=VALUATOR, 4=CHOICE, 5=PICK, 6=STRING).

devnum — **specified by user, fullword integer**
> Input device number (>=1).

start — **specified by user, fullword integer**
> Starting member in the list of available trigger types (>=1).

number — **specified by user, fullword integer**
> Number of triggers requested from the list (>=0).

errind — **returned by the graPHIGS API, fullword integer**

> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> | | |
> |---|---|
> | **23** | SPECIFIED WORKSTATION TYPE DOES NOT EXIST |
> | **38** | WORKSTATION HAS ONLY OUTPUT CAPABILITIES |
> | **140** | DEVICE NUMBER < ONE OR DEVICE NOT AVAILABLE |
> | **328** | INPUT CLASS VALUE IS INVALID |
> | **538** | START VALUE < ONE |
> | **539** | REQUESTED NUMBER < ZERO |
> | **543** | START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED |
> | **548** | SPECIFIED WORKSTATION TYPE CANNOT BE LOADED |
> | **569** | DEVICE DOES NOT SUPPORT PROGRAMMABLE TRIGGERS |

ntrigs — **returned by the graPHIGS API, fullword integer**

> Total number of entries in the list of available triggers.

ltrigs — **returned by the graPHIGS API, array of fullword integers**

> List of trigger descriptor triplets. The list is an array of trigger descriptors in which each descriptor consists of three fullword integers designating the trigger type, low trigger qualifier, and high trigger qualifier. The trigger type field has the following meanings:

Type	Meaning
>0	Identifier of physical device within the button category. The trigger qualifiers for this trigger type are a range of choice numbers generated by the physical device.
-1	Change of the measure of the logical input device. Ignore the trigger qualifier fields.
-2	The secondary trigger fires when the primary trigger fires. This type is valid only for secondary (>0) trigger list identifier. Ignore the trigger qualifier fields.

The parameter *ntrigs* identifies the total number of triplets in the available trigger list. The actual number returned will depend on the setting of the *start* and *number* parameters. **Error Codes**

None

GPQITS - Inquire Input Device Trigger State

GPQITS (*wsid*, *class*, *devnum*, *listid*, *start*, *number*, *errind*, *ntrigs*, *ltrigs*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQITS** to inquire the current trigger list for a specified level of a particular device on a specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
    Workstation identifier.

class — **specified by user, fullword integer**
    Input device class (1=LOCATOR, 2=STROKE, 3=VALUATOR, 4=CHOICE, 5=PICK, 6=STRING).

devnum — **specified by user, fullword integer**
    Input device number (>=1).

listid — **specified by user, fullword integer**
    Trigger list identifier for return of trigger list (>=0).

    Trigger list identifier zero is always present and is called the primary trigger. The primary trigger causes the input to be returned to the application.

    Secondary triggers may have different intermediate functions used in the processing of the input. They are identified with trigger list identifiers beginning with 1.

start — **specified by user, fullword integer**
    Starting member in the list of current triggers (>=1).

number — **specified by user, fullword integer**
    Number of triggers requested from the list (>=0).

errind — **returned by the graPHIGS API, fullword integer**
    Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

    25   SPECIFIED WORKSTATION DOES NOT EXIST

    38   WORKSTATION HAS ONLY OUTPUT CAPABILITIES

    140   DEVICE NUMBER < ONE OR DEVICE NOT AVAILABLE

    328   INPUT CLASS VALUE IS INVALID

    538   START VALUE < ONE

    539   REQUESTED NUMBER < ZERO

    543   START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

ntrigs — **returned by the graPHIGS API, fullword integer**
> Number of triggers in the current trigger list.

ltrigs — **returned by the graPHIGS API, array of fullword integers**
> List of trigger descriptor triplets. The list is an array of trigger descriptors in which each descriptor consists of 3 fullword integers designating the trigger type, low trigger qualifier, and high trigger qualifier. The trigger type field has the following meanings:

Type	Meaning
-1	Change of the measure of the corresponding physical input device. The low qualifier specifies the granularity of movement which causes the trigger to fire. The granularity is specified as the amount that the physical device measure must change since the last trigger was fired in order for the trigger to be fired again. The high qualifier will be zero.
0	An implementation dependent trigger that is only valid as the default value.
>0	Physical device number within the button category. The trigger qualifiers for this trigger type are a range of choices on the indicated physical device.

The parameter *ntrigs* identifies the total number of triplets in the available trigger list. The actual number returned will depend on the setting of the *start* and *number* parameters.

GPQIVF - Inquire Invisibility Filter

GPQIVF (*wsid*, *inlen*, *exlen*, *errind*, *inclen*, *incl*, *exclen*, *excl*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQIVF** to inquire the current invisibility filter values for the visibility inclusion and exclusion filters on the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 533 (an output parameter is not large enough for all the requested data), then the values up to the length specified are returned. If the inquired

information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid **— specified by user, fullword integer**
Workstation identifier.

inlen **— specified by user, fullword integer**
Length of inclusion filter array provided by the application for the graPHIGS API to return the corresponding filters (>=0).

This is the size of the array provided by the application for the graPHIGS API to return the corresponding data.

exlen **— specified by user, fullword integer**
Length of exclusion filter array provided by the graPHIGS API to return the corresponding filter (>=0).

This is the size of the array provided by the application for the graPHIGS API to return the corresponding data.

errind **— returned by the graPHIGS API, fullword integer**
If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
505	LENGTH OF RETURN ARRAY < ZERO
533	INQUIRY DATA EXCEEDS AREA. OUTPUT TRUNCATED

inclen **— returned by the graPHIGS API, fullword integer**
Number of class names in the inclusion filter.

incl **— returned by the graPHIGS API, array of fullword integers.**
List of class names in the inclusion filter.

exclen **— returned by the graPHIGS API, fullword integer**
Number of class names in the exclusion filter length.

excl **— returned by the graPHIGS API, array of fullword integers.**
List of class names in the exclusion filter.

GPQIW - Inquire List of Images on the Workstation

GPQIW (*wsid*, *start*, *number*, *errind*, *totnum*, *lindex*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQIW** to inquire the currently defined images on the specified workstation. Images were defined on the workstation by the Define Image (**GPDFI**) subroutine.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

start — **specified by user, fullword integer**
> Starting member of the list of indexes of defined images (>=1).

number — **specified by user, fullword integer**
> Number of image indexes requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> | | |
> |---|---|
> | **25** | SPECIFIED WORKSTATION DOES NOT EXIST |

GPQLC - Inquire Locator Device State

GPQLC (*wsid*, *device*, *type*, *length*, *errind*, *mode*, *echosw*, *view*, *pos*, *echo*, *area*, *datalen*, *data*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQLC** to inquire the current state of a locator device attached to a specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 533 (an output parameter is not large enough for all the requested data), then the values up to the length specified are returned. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

device — **specified by user, fullword integer**
Locator device number.

type — **specified by user, fullword integer**
Type of returned values (1=SET).

length — **specified by user, fullword integer**
Length of array, in bytes, provided by the application for the graPHIGS API to return the locator data record array.

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

25	SPECIFIED WORKSTATION DOES NOT EXIST
38	WORKSTATION HAS ONLY OUTPUT CAPABILITIES
140	DEVICE NUMBER < ONE OR DEVICE NOT AVAILABLE
509	DATA LENGTH VALUE < ZERO OR REQUIRED LENGTH
533	INQUIRY DATA EXCEEDS AREA. OUTPUT TRUNCATED
534	TYPE VALUE IS INVALID

mode — **returned by the graPHIGS API, fullword integer**
Current operating mode (1=REQUEST, 2=SAMPLE, 3=EVENT, 4=APPLICATION_DEFINED). The graPHIGS API only returns a mode of 4=APPLICATION_DEFINED if the application set the device mode using the Set Input Device State (**GPIDMO**) subroutine and the mode does not emulate Request, Sample or Event mode.

echosw — **returned by the graPHIGS API, fullword integer**
Current echo switch (1=NOECHO, 2=ECHO).

view — **returned by the graPHIGS API, fullword integer**
　　Current initial view index.

pos — **returned by the graPHIGS API, 3 short floating-point numbers (WC)**
　　Current initial locator position.

echo — **returned by the graPHIGS API, fullword integer**
　　Current prompt/echo type.

area — **returned by the graPHIGS API, 6 short floating-point numbers (DC)**
　　Current echo area (Xmin, Xmax, Ymin, Ymax, Zmin, Zmax).

datalen — **returned by the graPHIGS API, fullword integer**
　　Current locator data record length.

data — **returned by the graPHIGS API, variable length data**
　　Current locator data record.

GPQLCF - Inquire List of Color Facilities

GPQLCF (*wstype*, *number*, *ids*, *errind*, *data*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQLCF** to inquire one or more groups describing the color facilities for the specified workstation.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8 byte character string**
　　Workstation type.

number — **specified by user, fullword integer**
　　Number of groups requested (>=1).

ids — **specified by user, array of fullword integers**
> A list of group identifiers.

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **23**   SPECIFIED WORKSTATION TYPE DOES NOT EXIST

> **35**   WORKSTATION HAS ONLY INPUT CAPABILITIES

> **272**   GROUP IDENTIFIER IS INVALID

> **273**   NUMBER OF GROUP IDENTIFIERS < ONE

> **548**   SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

data — **returned by the graPHIGS API, array of fullword quantities**
> Data array. When you specify a list of group identifiers, the data is returned to your application in the order you specified your request. Below is a list of the contents of each group:

> **Group Identifier 1 - Color model of the workstation**
>> A fullword integer (`1=RGB, 2=HSV, 3=CMY, 4=CIELUV`).

> **Group Identifier 2 - Color available on the workstation**
>> A fullword integer (`1=MONOCHROME, 2=COLOR`).

> **Group Identifier 3 - Number of available colors (total color palette size)**
>> A fullword integer indicating the number of available colors on the workstation.

> **Group Identifier 4 - Number of predefined default color table entries**
>> A fullword integer indicating the number of predefined default color table entries.

> **Group Identifier 5 - Number of definable color processing mode table entries**
>> A fullword integer indicating the number of definable color processing mode table entries.

> **Group Identifier 6 - Number of predefined color processing mode table entries**
>> A fullword integer indicating the number of predefined color processing mode table entries.

> **Group Identifier 7 - Order of color components for color quantization**
>> A fullword integer (`1=RGB, 2=BGR`).

> **Group Identifier 8 - `CIELUV` color components**
>> An array of nine floating-point numbers which are the color components for the three monitor primaries (`1=RGB`). For each monitor primary, graPHIGS API returns the `CIELUV` chromaticity coefficients (u', v') and the luminance value Y.

GPQLI - Inquire List of Logical Input Devices

GPQLI (*wstype*, *class*, *start*, *number*, *errind*, *ndev*, *dev*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQLI** to inquire the number of available logical input devices for the specified device class for the specified workstation type.

The graPHIGS API returns data indicating the total number of logical input devices and their device numbers for the specified class.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
    Workstation type.

class — **specified by user, fullword integer**
    Device class (1=LOCATOR, 2=STROKE, 3=VALUATOR, 4=CHOICE, 5=PICK, 6=STRING).

start — **specified by user, fullword integer**
    Starting member of the list of input devices (>=1).

number — **specified by user, fullword integer**
    Number of input device numbers requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
    Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

    23   SPECIFIED WORKSTATION TYPE DOES NOT EXIST

    38   WORKSTATION HAS ONLY OUTPUT CAPABILITIES

    328   INPUT CLASS VALUE IS INVALID

    538   START VALUE < ONE

    539   REQUESTED NUMBER < ZERO

    543   START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

    548   SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

ndev — **returned by the graPHIGS API, fullword integer**
    Total number of logical device numbers in the device class.

dev — **returned by the graPHIGS API, array of fullword integers.**
    List of device numbers in the device class. The output array must be large enough for the requested data.

GPQLNR - Inquire List of Line Rendering Styles

GPQLNR (*wstype*, *start*, *number*, *errind*, *totnum*, *rstyle*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQLNR** to inquire the list of line rendering styles for a specified workstation.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
    Workstation type.

start — **specified by user, fullword integer**
    Starting member of the list of line rendering styles (>=1).

number — **specified by user, fullword integer**
    Number of line rendering styles requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
    Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

23	SPECIFIED WORKSTATION TYPE DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
538	START VALUE < ONE
539	REQUESTED NUMBER < ZERO
543	START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED
548	SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

totnum — **returned by the graPHIGS API, fullword integer**
    Total number of available line rendering styles supported by a workstation.

rstyle — **returned by the graPHIGS API, array of fullword integers**
   List of line rendering styles (1=`WORKSTATION_DEPENDENT_RENDERING`, 2=`SCALED_TO_FIT_RENDERING`).

GPQLSF - Inquire Light Source Facilities

GPQLSF (*wstype*, *start*, *number*, *errind*, *maxe*, *totnum*, *ltype*, *maxa*, *npred*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQLSF** to inquire the light source facilities for the specified workstation.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
   Workstation type.

start — **specified by user, fullword integer**
   Starting member of the list of available light source types (>=1).

number — **specified by user, fullword integer**
   Number of light source type entries requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
   Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

   23 SPECIFIED WORKSTATION TYPE DOES NOT EXIST

   35 WORKSTATION HAS ONLY INPUT CAPABILITIES

   538 START VALUE < ONE

   539 REQUESTED NUMBER < ZERO

543   START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

548   SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

maxe — **returned by the graPHIGS API, fullword integer**
Maximum number of light source table entries.

totnum — **returned by the graPHIGS API, fullword integer**
Total number of available light source types supported on the workstation.

ltype — **returned by the graPHIGS API, array of fullword integers**
List of light source types (`1=AMBIENT, 2=DIRECTIONAL, 3=POSITIONAL, 4=SPOT`).

maxa — **returned by the graPHIGS API, fullword integer**
Maximum number of simultaneously active non-ambient light sources.

npred — **returned by the graPHIGS API, fullword integer**
Number of predefined light source indexes.

GPQLSR - Inquire Light Source Representation

GPQLSR (*wsid*, *index*, *type*, *errind*, *lstype*, *color*, *data*)

Note: This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQLSR** to inquire the current attribute values in the specified entry in the light source table of the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

The data parameter (*data*) must be large enough to include the maximum number of light source parameters.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

index — **specified by user, fullword integer**
> Light source table index (>=1).

type — **specified by user, fullword integer**
> Type of returned values (1=SET).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **25**   SPECIFIED WORKSTATION DOES NOT EXIST

> **35**   WORKSTATION HAS ONLY INPUT CAPABILITIES

> **254**   LIGHT SOURCE INDEX < ONE

> **255**   LIGHT SOURCE INDEX EXCEEDS THE WORKSTATION TABLE CAPACITY

> **534**   TYPE VALUE IS INVALID

lstype — **returned by the graPHIGS API, fullword integer**
> Light source type (1=AMBIENT, 2=DIRECTIONAL, 3=POSITIONAL, 4=SPOT).

color — **returned by the graPHIGS API, four fullwords of data**
> Light source color. This parameter includes one of the following two formats:

```
    indexed format                    direct format
    -------------                     -------------
  0 |           1| fullword integer  0 |           2| fullword integer
    |-----------|                      |-----------|
  4 |color index| fullword integer   4 |component 1| short floating-point
number                                             number
    |-----------|                      |-----------|
  8 |   reserved| fullword integer   8 |component 2| short floating-point
number                                             number
    |-----------|                      |-----------|
 12 |   reserved| fullword integer  12 |component 3| short floating-point
number                                             number
    -------------                     -------------
```

data — **returned by the graPHIGS API, array of short floating-point numbers**
> List of light source parameters. Values returned to this parameter depend on the light source type. The application must supply storage for this parameter that is large enough to contain the maximum data listed below:

> **1=AMBIENT**
>> None

> **2=DIRECTIONAL**
>> Light source direction 3 short floating-point numbers (WC)

> **3=POSITIONAL**
>> Light source position -3 short floating-point numbers (WC)
>>
>> Attenuation coefficients - 2 short floating-point numbers

> **4=SPOT** Light source position - 3 short floating-point numbers (WC). Light source direction - 3 short floating-point numbers (WC). Concentration exponent - short floating-point number. Attenuation coefficients - 2 short floating-point numbers. Spread angle - short floating-point number.

GPQLTF - Inquire Linetype Facilities

GPQLTF (*wstype*, *errind*, *sections*, *maxlen*, *unit*, *npred*, *available*)

Note: This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQLTF** to inquire the line pattern facilities for the specified workstation type.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the output parameter *available* is set to a value of one, then the values returned in the other output parameters are unpredictable. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype **— specified by user, 8-byte character string**
Workstation type.

errind **— returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

   23   SPECIFIED WORKSTATION TYPE DOES NOT EXIST

   35   WORKSTATION HAS ONLY INPUT CAPABILITIES

   548   SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

sections **— returned by the graPHIGS API, fullword integer**
Maximum number of sections that a line pattern can have.

maxlen **— returned by the graPHIGS API, fullword integer**
Maximum length of a line pattern. The sum of the lengths of all sections in a line pattern must be less than this value.

unit **— returned by the graPHIGS API, short floating-point number (DC)**
Size of the line pattern unit. All line pattern definitions are specified as multiples of this value.

npred — **returned by the graPHIGS API, fullword integer**
> Number of predefined entries of the line pattern table.

available — **returned by the graPHIGS API, fullword integer**
> Availability of the Set Linetype Representation (**GPLTR**) subroutine and Inquire Linetype Representation(**GPQLTR**) subroutine (1=NOT_AVAILABLE, 2=BOTH_AVAILABLE, 3=INQUIRE_ONLY_AVAILABLE, 4=SET_ONLY_AVAILABLE).

Error Codes

GPQLTR - Inquire Linetype Representation

> GPQLTR (*wsid*, *ltype*, *errind*, *number*, *pattern*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQLTR** to inquire the current line pattern in the specified entry in the line type table of the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

ltype — **specified by user, fullword integer**
> Line type table index (>=1).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **25**   SPECIFIED WORKSTATION DOES NOT EXIST

35	WORKSTATION HAS ONLY INPUT CAPABILITIES
63	LINETYPE VALUE < ONE
64	SPECIFIED LINETYPE NOT AVAILABLE ON WORKSTATION
274	THIS FUNCTION IS NOT SUPPORTED BY THE WORKSTATION

number — **returned by the graPHIGS API, fullword integer**
> Number of sections in the line pattern.

pattern — **returned by the graPHIGS API, array of fullword integers**
> List of the length of each section in the line pattern. The entries of the array alternate between SOLID and VOID sections with the first entry being SOLID. Each length is specified in terms of a multiple of the minimum size section for the workstation. The application must supply storage for this parameter that is large enough to contain the maximum number of sections that this workstation supports.

GPQLW - Inquire Length of Workstation State Tables

GPQLW (*wstype, errind, ltable, mtable, ttable, itable, etable, pttable, ctable*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQLW** to inquire the maximum number of entries supported for workstation tables for the specified workstation type.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the output parameter *available* is set to a value of one, then the values returned in the other output parameters are unpredictable. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
> Workstation type.

errind — **returned by the graPHIGS API, fullword integer**
    Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of
    the following errors exists:

23   SPECIFIED WORKSTATION TYPE DOES NOT EXIST

35   WORKSTATION HAS ONLY INPUT CAPABILITIES

548   SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

ltable — **returned by the graPHIGS API, fullword integer**
    Maximum number of polyline bundle table entries.

mtable — **returned by the graPHIGS API, fullword integer**
    Maximum number of polymarker bundle table entries.

ttable — **returned by the graPHIGS API, fullword integer**
    Maximum number of text bundle table entries.

itable — **returned by the graPHIGS API, fullword integer**
    Maximum number of interior bundle table entries.

etable — **returned by the graPHIGS API, fullword integer**
    Maximum number of edge bundle table entries.

pttable — **returned by the graPHIGS API, fullword integer**
    Maximum number of pattern indexes.

ctable — **returned by the graPHIGS API, fullword integer**
    Maximum number of default color table entries.

GPQMDS - Inquire Mapped Display Surface Size

GPQMDS (*wsid*, *errind*, *units*, *csize*, *asize*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQMDS** to inquire the size of the mapped display surface on the specified workstation. The mapped display surface is the subarea of the window that the workstation uses as the workstation's display surface for graphical output and input. Only workstations which use the facilities of a window system (e.g., X-Windows) support this inquire.

The mapped display surface size may change if the user changes the size of the window that contains the mapped display surface. By enabling the Window Resize Notification function of the Escape (**GPES**) subroutine, your application can receive notification of such size changes. Then issue **GPQMDS**) to obtain the new size of the mapped display surface. In addition, your application can control the aspect ratio of the mapped display surface by using the Window Aspect Ratio (`XWINDASP`) procopt.

If your application uses the **GPDCMM** subroutine and sets the method to `2=DIRECT`, then the graPHIGS API returns the current size of the window, constrained to the same area as the root window. If the method is set to `1=MAPPED`, then the graPHIGS API returns the size of the area that is used to display the device coordinate range, constrained to an area with the same aspect ratio as the root window, centered in the window.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

This subroutine is assigned escape identifier 1010.

> **Note:** This subroutine is an escape subroutine, and therefore, may not be available on all workstations. Use the Inquire List of Available Escape Subroutines (**GPQES**) subroutine to determine if this subroutine is supported by a specific workstation.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **25** SPECIFIED WORKSTATION DOES NOT EXIST

> **35** WORKSTATION HAS ONLY INPUT CAPABILITIES

> **527** ESCAPE FUNCTION NOT AVAILABLE

units — **returned by the graPHIGS API, fullword integer**
> Mapped display surface coordinate units (`1=METERS`, `2=OTHER`).

csize — **returned by the graPHIGS API, 3 short floating-point numbers**
Mapped display size surface in Device Coordinate (DC) units.

asize — **returned by the graPHIGS API, 3 fullword integers**
Mapped display surface size in address units.

GPQNCC - Inquire Nucleus Connection State

GPQNCC (*ncid*, *state*)

> **Note:** This subroutine is a graPHIGS API State List (PSL) inquiry. For an overview, see ″PSL Inquiries.″

Purpose

Use **GPQNCC** to inquire the application process's connection state to the specified nucleus. The returned state will indicate:

`1=ACTIVE`
The application process is connected to the specified nucleus and the communication path is active.

`2=INACTIVE`
The application process is connected to the nucleus but the communication path is no longer active. The application process should issue a Disconnect from Nucleus (**GPDNC**) subroutine, to clean up and close the connection.

`3=NON_EXISTENT`
The specified nucleus does not exist. Therefore, the application process is not connected to the specified nucleus at this time.

Parameters

ncid — **specified by user, fullword integer**
Nucleus identifier.

status — **returned by the graPHIGS API, fullword integer**
Status of the application's connection state to the nucleus (`1=ACTIVE`, `2=INACTIVE`, `3=NON_EXISTENT`).

GPQNCE - Inquire Nucleus Environment

GPQNCE (*ncid*, *length*, *datatype*, *errind*, *hardware*, *datalen*, *data*)

> **Note:** This subroutine is a Nucleus Description Table (NDT) inquiry. For an overview, see ″NDT Inquiries.″

Purpose

Use **GPQNCE** to determine the environment information for the specified nucleus.

The graPHIGS API uses the *datatype* parameter to determine the type of environment information the graPHIGS API returns. If you specify a type of 1=SYSTEM_LEVEL, then the graPHIGS API returns the hardware and operating system environment information. If you specify a type of 2=ENVIRONMENT_DESCRIPTOR, then the graPHIGS API returns an environment descriptor, which is an indicator for the character encoding, floating-point format, and byte order specification for the specified nucleus. Use this descriptor as input to the Convert Data (**GPCVD**) subroutine.

Parameters

ncid — **specified by user, fullword integer**
Nucleus identifier.

length — **specified by user, fullword integer**
Length, in bytes, of the data area specified by *data* into which the graPHIGS API returns the environment information.

datatype — **specified by user, fullword integer**
Type of environment information to be returned (1=SYSTEM_LEVEL, 2=ENVIRONMENT_DESCRIPTOR).

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. Zero indicates that the request has completed successfully.

202	SPECIFIED NUCLEUS DOES NOT EXIST
509	DATA LENGTH VALUE < ZERO OR REQUIRED LENGTH
526	REQUESTED DATA NOT AVAILABLE FOR THIS FUNCTION
534	TYPE VALUE IS INVALID

hardware — **returned by the graPHIGS API, fullword integer**
Hardware type on which the nucleus is executing (1=RISC_6000, 2=IBM_6095, 3=IBM_370).

datalen — **returned by the graPHIGS API, fullword integer**

> Length of data returned in the data area specified by the *data* parameter.

data — **returned by the graPHIGS API, variable length data**

> Operating system specific data. The value of each field is expressed in the data format listed below:

> **Type 1**
> > SYSTEM_LEVEL
> >
> > - Four fullwords of data defined as follows:

```
      ---------------------
   0  |       opsys        |  fullword integer

GPQNCN - Inquire Number of Available Class Names

GPQNCN (*wstype*, *errind*, *number*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQNCN** to inquire the total number of class names that are available for the specified workstation type.

The graPHIGS API returns data indicating the maximum number of class names that are available for the specified workstation type.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
> Workstation type.

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **23** SPECIFIED WORKSTATION TYPE DOES NOT EXIST

> **548** SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

number — **returned by the graPHIGS API, fullword integer**
> Number of available class names.

> **Note:** This subroutine is a graPHIGS API State List (PSL) inquiry. For an overview, see ″PSL Inquiries.″

Purpose

Use **GPQNCR** to inquire the nucleus resource identifier of the specified resource. It is the resource identifier assigned by the nucleus when the resource was created.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

type — **specified by user, fullword integer**
    Resource type (1=WORKSTATION, 2=STRUCTURE_STORE, 3=IMAGE_BOARD, 4=FONT_DIRECTORY, 5=ARCHIVE_FILE).

id — **specified by user, fullword integer**
    Identifier of the resource as known to the shell.

errind — **returned by the graPHIGS API, fullword integer**
    Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

    25   SPECIFIED WORKSTATION DOES NOT EXIST

    211   RESOURCE TYPE IS INVALID

    220   SPECIFIED ARCHIVE FILE DOES NOT EXIST

    222   SPECIFIED STRUCTURE STORE DOES NOT EXIST

    232   SPECIFIED IMAGE BOARD DOES NOT EXIST

    242   SPECIFIED FONT DIRECTORY DOES NOT EXIST

ncid — **returned by the graPHIGS API, fullword integer**
    Nucleus identifier.

rid — **returned by the graPHIGS API, fullword integer**
    Nucleus resource identifier.

GPQNCS - Inquire Available Nucleus Storage Size

GPQNCS (*ncid*, *errind*, *size*)

Note: This subroutine is a Nucleus State List (NSL) inquiry. For an overview, see ″NSL Inquiries.″

Purpose

Use **GPQNCS** to determine the amount of free storage available to the nucleus for resource allocation and modification. The returned value may only be approximate since the memory allocation mechanisms may be different in each environment. Requests from other applications connected to this nucleus will compete for this storage.

A value of zero indicates there is unlimited storage available.

Parameters

ncid — **specified by user, fullword integer**
Nucleus identifier.

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

202   SPECIFIED NUCLEUS DOES NOT EXIST

571   INQUIRED INFORMATION IS NOT AVAILABLE

size — **returned by the graPHIGS API, fullword integer**
The number of bytes of free storage currently available to the nucleus.

GPQNS - Inquire Nucleus Specification

GPQNS (*ncid*, *ilen*, *errind*, *conn*, *olen*, *spec*)

> **Note:** This subroutine is a Nucleus Description Table (NDT) inquiry. For an overview, see ″NDT Inquiries.″

Purpose

Use **GPQNS** to inquire the nucleus connection method and specification that was used to connect the application process to the specified nucleus.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 536 (the actual connection specification is greater than the length of the area provided), then only the actual length (*olen*) of the connection specification is returned. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

ncid — **specified by user, fullword integer**
> Nucleus identifier.

ilen — **specified by user, fullword integer**
> Length of the area provided to contain the nucleus connection specification.

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **202** SPECIFIED NUCLEUS DOES NOT EXIST

> **536** INQUIRY DATA EXCEEDS AREA. LENGTH OF REQUIRED AREA RETURNED

conn — **returned by the graPHIGS API, fullword integer**
> Nucleus connection method.

olen — **returned by the graPHIGS API, fullword integer**
> Actual length of the nucleus connection specification.

spec — **returned by the graPHIGS API, variable data**
> Nucleus connection specification. For a description of the format of the nucleus specification, see the Connect Nucleus (**GPCNC**) subroutine.

GPQNSP - Inquire Number of Structure Priorities Supported

GPQNSP (*wstype*, *errind*, *npri*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQNSP** to inquire the number of the structure priorities supported for the specified workstation type.

When associating a structure to a view, the application specifies a structure priority, which is a real number between 0.0 and 1.0. The structures in each view are traversed in order, from lowest to highest priority.

The graPHIGS API returns values indicating the total number of supported structure priorities. For example, if a workstation uses a 4-bit mask to keep track of priorities, then it is able to support only 16 different priorities and must map the real number to one of 16 values. If a workstation can support a continuous range of structure priorities, then the inquiry returns a value of zero.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
Workstation type.

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

23	SPECIFIED WORKSTATION TYPE DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
548	SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

npri — **returned by the graPHIGS API, fullword integer**
Number of structure priorities supported. The value zero indicates that the workstation supports a continuous range of structure priorities.

GPQNST - Inquire Number of Secondary Triggers

GPQNST (*wstype*, *class*, *devnum*, *errind*, *number*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQNST** to inquire the number of secondary triggers for a specified device for the specified workstation type.

A zero is returned if the specified device has only a primary trigger.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
Workstation type.

class — **specified by user, fullword integer**
Input device class (1=LOCATOR, 2=STROKE, 3=VALUATOR, 4=CHOICE, 5=PICK, 6=STRING).

devnum — **specified by user, fullword integer**
Input device number (>=0).

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

23	SPECIFIED WORKSTATION TYPE DOES NOT EXIST
38	WORKSTATION HAS ONLY OUTPUT CAPABILITIES
140	DEVICE NUMBER < ONE OR DEVICE NOT AVAILABLE
328	INPUT CLASS VALUE IS INVALID
548	SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

number — **returned by the graPHIGS API, fullword integer**
Number of secondary triggers for the specified device.

GPQNV - Inquire Number of Definable View Table Entries

GPQNV (*wstype*, *errind*, *number*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQNV** to inquire the number of definable view table entries for the specified workstation type.

The graPHIGS API returns data indicating the maximum number of views that can be defined in the view table for the specified workstation type. View zero is not included since it cannot be modified.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
Workstation type.

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

23 SPECIFIED WORKSTATION TYPE DOES NOT EXIST

35 WORKSTATION HAS ONLY INPUT CAPABILITIES

548 SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

number — **returned by the graPHIGS API, fullword integer**
Number of definable view table entries. Entry 0 of the view table may not be changed.

GPQOPS - Inquire Open Structure

GPQOPS (*type*, *strid*)

> **Note:** This subroutine is a Structure State List (SSL) inquiry. For an overview, see *"SSL Inquiries."*

Purpose

Use **GPQOPS** to inquire the identifier of the open structure in the currently selected structure store.

If a structure is open, the graPHIGS API returns data indicating the type of open structure and the structure's identifier. If no structure is currently open, a type of `1=NIL` is returned.

Parameters

type — **returned by the graPHIGS API, fullword integer**
> Type of open structure (`1=NIL`, `2=STRUCTURE`).

strid — **returned by the graPHIGS API, fullword integer**
> Identifier of the open structure if type returned is `2=STRUCTURE`. If the value returned in the *type* parameter is `1=NIL`, this parameter is not set by the graPHIGS API and should be ignored.

GPQOPW - Inquire Set of Open Workstations

GPQOPW (*start*, *number*, *errind*, *totnum*, *lwsid*)

> **Note:** This subroutine is a graPHIGS API State List (PSL) inquiry. For an overview, see *"PSL Inquiries."*

Purpose

Use **GPQOPW** to inquire the list of the currently open workstations on a nucleus with an identifier of 1.

The graPHIGS API returns data indicating the total number of open workstation identifiers and a list of these identifiers that exist on a nucleus with an identifier of 1.

If the inquired information is available, the error indicator is returned as zero, and the values are returned in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available

data), then only the total-number parameter is set. If the inquired information is unavailable, the error indicator contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

start — **specified by user, fullword integer**
>   Starting member of the list of open workstations (>=1).

number — **specified by user, fullword integer**
>   Number of open workstation identifiers requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
>   Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

>   **202**   SPECIFIED NUCLEUS DOES NOT EXIST

>   **538**   START VALUE < ONE

>   **539**   REQUESTED NUMBER < ZERO

>   **543**   START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

totnum — **returned by the graPHIGS API, fullword integer**
>   Total number of open workstations.

lwsid — **returned by the graPHIGS API, array of fullword integers.**
>   List of open workstation identifiers. The output array must be large enough to contain the requested data.

GPQPAF - Inquire Pattern Facilities

GPQPAF (*wstype*, *errind*, *maxrow*, *maxcol*, *indexes*)

Note: This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQPAF** to inquire the pattern facilities for the specified workstation type.

The graPHIGS API returns the maximum pattern array dimensions, including the maximum number of rows (*maxrow*) and columns (*maxcol*) and the number of predefined pattern indexes (*indexes*) for the specified workstation.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
> Workstation type.

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **23**   SPECIFIED WORKSTATION TYPE DOES NOT EXIST

> **35**   WORKSTATION HAS ONLY INPUT CAPABILITIES

> **548**   SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

maxrow — **returned by the graPHIGS API, fullword integer**
> Maximum number of rows in the pattern array.

maxcol — **returned by the graPHIGS API, fullword integer**
> Maximum number of columns in the pattern array.

indexes — **returned by the graPHIGS API, fullword integer**
> Number of predefined pattern indexes.

Error Codes

GPQPAR - Inquire Pattern Representation

GPQPAR (*wsid*, *index*, *type*, *maxrow*, *maxcol*, *errind*, *drow*, *dcol*, *array*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQPAR** to inquire the current pattern representation in the specified entry in the pattern table of the specified workstation. This includes the pattern array row dimensions (*drow*), the column dimensions (*dcol*), and the pattern array (*array*) for the requested table entry.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 533 (an output parameter is not large enough for all the requested data), then the values up to the length specified are returned. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
  Workstation identifier.

index — **specified by user, fullword integer**
  Pattern table index (>=1).

type — **specified by user, fullword integer**
  Type of returned values (1=SET).

maxrow — **specified by user, fullword integer**
  Maximum number of rows to be returned by the graPHIGS API.

maxcol — **specified by user, fullword integer**
  Maximum number of columns to be returned by the graPHIGS API.

errind — **returned by the graPHIGS API, fullword integer**
  Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
48	PATTERN INDEX EXCEEDS WORKSTATION TABLE CAPACITY
85	PATTERN INDEX VALUE < ONE
90	INTERIOR STYLE NOT SUPPORTED ON WORKSTATION
91	STARTING POINT OR DIMENSION < ONE
533	INQUIRY DATA EXCEEDS AREA. OUTPUT TRUNCATED
534	TYPE VALUE IS INVALID

drow — **returned by the graPHIGS API, fullword integer**
  Pattern array row dimension (number of rows).

dcol — **returned by the graPHIGS API, fullword integer**
  Pattern array column dimension (number of columns). The output parameters *drow* and *dcol* identify the actual size of the requested pattern entry. Depending on the values of *maxrow* and *maxcol*, these may or may not match the amount of data actually placed in the output area.

array — **returned by the graPHIGS API, array of fullword integers.**
  Pattern array of color indexes in row order. The pattern array of color indexes is returned within the array bounds specified by *maxrow* and *maxcol*. Each pattern row is returned in the corresponding row of array beginning in column one. The high numbered rows and columns of the returned pattern are omitted as necessary to fit the number of rows and columns specified for array by *maxrow* and *maxcol*. Error indicator 533 is set in this case. If either dimension of the pattern is smaller than the dimension of array, the unused elements contain unpredictable values.

GPQPAS - Inquire Ancestors of Structure

GPQPAS (*strid*, *order*, *depth*, *start*, *number*, *buflen*, *errind*, *actnum*, *actlen totnum*, *data*, *termcond*)

>**Note:** This subroutine is a Structure State List (SSL) inquiry. For an overview, see ″SSL Inquiries.″

Purpose

Use **GPQPAS** to inquire the ancestral paths of a specified structure from the currently selected structure store. A path of ancestors of a structure *S* is a list of ordered pairs ((*A*1, *E*1), (*A*2, *E*2), (*S*,0)) where each ordered pair consists of an identifier of a structure (*Ax*) that is an ancestor of the specified structure (*S*) and the position of an execute structure-type element (*Ex*) that references the next structure in the path. Ancestor structure *A1* is the top of the path (e.g., it is not referenced by any other structure) and *S* is the bottom of the path.

The path order and path depth determine the portion of each path to be returned. The path depth determines the maximum number of ordered pairs returned in any one path. Specifying a path depth of zero returns each path in its entirety. When truncation occurs, the path order determines whether the head or tail portion of the path is returned. This truncation may result in two or more portions of paths having the same set of element references. Only one such portion is returned so that all of the returned path portions are distinct.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

strid — **specified by user, fullword integer**
>Structure identifier.

order — **specified by user, fullword integer**
>Path order (`1=TOPFIRST`, `2=BOTTOMFIRST`).

depth — **specified by user, fullword integer**
>Path depth (>=0).

start — **specified by user, fullword integer**
>Starting member of the list of paths (>=1).

number — **specified by user, fullword integer**
>Number of paths requested (>=0).

buflen — **specified by user, fullword integer**
> Length, in bytes, of the specified data parameter (*data*) (>=0).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **12** FUNCTION REQUIRES STATE SSSL

> **122** STRUCTURE IDENTIFIER DOES NOT EXIST

> **538** START VALUE < ONE

> **539** REQUESTED NUMBER < ZERO

> **543** START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

> **552** PATH ORDER IS INVALID

> **558** PATH DEPTH < ZERO

> **577** BUFFER LENGTH IS < ZERO

actnum — **returned by the graPHIGS API, fullword integer**
> Total number of paths returned.

actlen — **returned by the graPHIGS API, fullword integer**
> Total length, in bytes, of the paths returned in the data parameter (*data*).

totnum — **returned by the graPHIGS API, fullword integer**
> Total number of the distinct paths available for the specified structure identifier.

data — **returned by the graPHIGS API, variable data**
> The data buffer into which the paths are to be returned. The format of the data is as follows:

```
                       --------------------
      Start of buffer  |       path 1      |
                       |-------------------|
                       |       path 2      |
                       |-------------------|
                       |                   |
                       Z                   Z
                       |-------------------|
       End of buffer   |       path n      |
                       --------------------
```

> where each path has the following format:

```
              WORDS  1  |number of items in |  Fullword integer
                        |  the returned path|
                        |-------------------|
                     2  |   structure id 1  |  Fullword integer
                        |-------------------|
                     3  |  element number 1 |  Fullword integer
                        |-------------------|
                     4  |   structure id 2  |  Fullword integer
                        |-------------------|
                     5  |  element number 2 |  Fullword integer
                        |                   |
                        Z                   Z
                        |-------------------|
                        |   structure id m  |  Fullword integer
                        |-------------------|
                        |  element number m |  Fullword integer
                        --------------------
```

termcond — **returned by the graPHIGS API, fullword integer**
> Termination condition. The list of paths was terminated due to one of the following reasons:

> **1-Count Exhausted**
>> The requested number of paths have been returned.

> **2-Buffer Overflow**
>> The requested number of paths could not be returned because they would not all fit in the area provided. *actnum* contains the actual number returned.

> **3-End of Paths**
>> No more paths exists. This condition supersedes the Count Exhausted condition (if that condition was in effect). Because of this, the total number of paths may or may not be equal to the requested number of paths to be returned. *actnum* should be checked to find the actual number of paths returned.

> **4-Large Path**
>> The next path would not fit into the inbound buffer between the nucleus and the shell. *actnum* contains the number of paths returned excluding the path that would not fit.

GPQPCR - Inquire Predefined Color Representation

GPQPCR (*wstype*, *start*, *number*, *errind*, *npred*, *indexes*, *colors*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQPCR** to inquire the color values in the predefined color table entries in the default color table for the specified workstation. If you can modify the workstation's display color table, then the display color table is the workstation's default. Otherwise, the rendering color table is the workstation's default color table. Use the Inquire Extended Color Facilities (**GPQXCF**) subroutine to inquire the characteristics of the workstation's color table.

The graPHIGS API returns the predefined color components corresponding to the specified indexes. This data includes the total number of predefined color table entries (*npred*), the index of the color values (*indexes*), and the color components for those indexes (*colors*).

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is

unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype **— specified by user, 8-byte character string**
>Workstation type.

start **— specified by user, fullword integer**
>Starting member of the predefined default color table entries(>0).

number **— specified by user, fullword integer**
>Number of predefined default color table entries requested (>=0).

errind **— returned by the graPHIGS API, fullword integer**
>Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

>| **23** | SPECIFIED WORKSTATION TYPE DOES NOT EXIST |
>|---|---|
>| **35** | WORKSTATION HAS ONLY INPUT CAPABILITIES |
>| **538** | START VALUE < ONE |
>| **539** | REQUESTED NUMBER < ZERO |
>| **543** | START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED |
>| **548** | SPECIFIED WORKSTATION TYPE CANNOT BE LOADED |

npred **- returned by the graPHIGS API, fullword integer**
>Total number of predefined default color table entries.

indexes **— returned by the graPHIGS API, array of fullword integers**
>List of indexes of the predefined color representation. The output array must be large enough to contain the requested data.

colors **— returned by the graPHIGS API, array of short floating-point numbers**
>Color components to be interpreted by the default color model. The array contains a list of color table entries ordered by row. Each entry in the list refers to the corresponding index in the *indexes* array. The output array must be large enough to contain the requested data.

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see *″*WDT Inquiries.*″*

Purpose

Use **GPQPDC** to retrieve the characteristics of a physical input device for the specified workstation type.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 533 (an output parameter is not large enough for all the requested data), then the values up to the length specified are returned. If the inquired information is

unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
> Workstation type.

category — **specified by user, fullword integer**
> Physical device category (`1=BUTTON, 2=SCALAR, 3=2D_VECTOR`).

device — **specified by user, fullword integer**
> Physical device number (>=1).

number — **specified by user, fullword integer**
> Number of array entries for parameter *vrange* that have been provided by the application (>=0).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:
>
> | | |
> |---|---|
> | **23** | SPECIFIED WORKSTATION TYPE DOES NOT EXIST |
> | **140** | DEVICE NUMBER < ONE OR DEVICE NOT AVAILABLE |
> | **160** | PHYSICAL INPUT DEVICE CATEGORY IS INVALID |
> | **533** | INQUIRY DATA EXCEEDS AREA. OUTPUT TRUNCATED |
> | **539** | REQUESTED NUMBER < ZERO |
> | **548** | SPECIFIED WORKSTATION TYPE CANNOT BE LOADED |

flags — **returned by the graPHIGS API, fullword integer**
> Indicates whether this device is actually present and if it may be emulated by the application (`1=NOT_PRESENT_CANNOT_BE_EMULATED, 2=NOT_PRESENT_CAN_BE_EMULATED, 3=PRESENT_CANNOT_BE_EMULATED, 4=PRESENT_CAN_BE_EMULATED`).

type — **returned by the graPHIGS API, fullword integer**
> Type of physical input device. The interpretation of this parameter is dependent on the category of input device as follows:
>
> **Button -**
> > (`1=KEYBOARD, 2=OTHER`). This field identifies whether the button device is a keyboard or not.
>
> **Scalar -**
> > (`1=ABSOLUTE, 2=RELATIVE`). This parameter indicates whether the physical input device generates relative or absolute values.
>
> **2D Vector -**
> > (`1=ABSOLUTE, 2=RELATIVE`). This parameter indicates whether the physical input device generates relative or absolute values.

totnum — **returned by the graPHIGS API, fullword integer**
> Total number of value ranges that describe the specified physical input device.

vrange — **returned by the graPHIGS API, array of fullword integers**
> The parameter contains a list of integer pairs that define value ranges for the specified physical device. The interpretation of these value ranges are dependent on the category of the physical input device as follows:

Button -
> Each value range defines a series of button values that may be generated by the device.

Scalar -
> There is only one range for this device in all cases.

> If the physical device generates absolute values then this range defines the minimum and maximum value that may be generated. The minimum and maximum values generally correspond to the minimum and maximum range of the logical input device.

> If the device generates relative values, then the minimum of this range is always zero and has no meaning. The maximum of the range represents the number of increments in one unit of physical motion. A unit of physical motion is different for different physical devices.

> > **Note:** For a dial physical device, one unit of physical motion equals one turn of the dial.

2D Vector -
> There are two ranges for this device in all cases. The first corresponds to the *x* value that is generated and the second corresponds to the *y* value.

> If the physical device generates absolute values, then this range defines the minimum and maximum value that may be generated. The minimum and maximum values generally correspond to the edges of the screen in the case of a device connected to the graphics cursor.

> If the device generates relative values, then the minimum of this range is always zero and has no meaning. The maximum of the range represents the number of increments in one unit of physical motion. A unit of physical motion is different for different devices.

> > **Note:** For a mouse physical device, one unit of physical motion equals the amount of motion necessary to move the cursor from one edge of the screen to its opposite edge.

GPQPDS - Inquire Descendants of Structure

GPQPDS (*strid, order, depth, start, number, buflen, errind, actnum, actlen totnum, data, termcond*)

> **Note:** This subroutine is a Structure State List (SSL) inquiry. For an overview, see ″SSL Inquiries.″

Purpose

Use **GPQPDS** to inquire the descendant paths of a specified structure from the currently selected structure store. A path of descendants of a structure *S* is a list of ordered pairs ((S, $E0$), ($D1$, $E1$), ($D2$, $E2$), ...,

(*Dn*,0 *m*)), where each ordered pair consists of an identifier of a structure (*Dx*) that is a descendant of the specified structure (*S*) and the position of an execute structure-type element (*Ex*) that references the next structure in the path. The specified structure *S* is the top of the path and descendant structure *Dn* is the bottom of the path (e.g., it does not reference any other structure).

The path order and path depth determine the portion of each path to be returned. The path depth determines the maximum number of ordered pairs returned in any one path. Specifying a path depth of zero returns each path in its entirety. When truncation occurs, the path order determines whether the head or tail portion of the path is returned. This truncation may result in two or more portions of paths having the same set of element references. Only one such portion is returned so that all of the returned path portions are distinct.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

strid — **specified by user, fullword integer**
> Structure identifier.

order — **specified by user, fullword integer**
> Path order (1=TOPFIRST, 2=BOTTOMFIRST).

depth — **specified by user, fullword integer**
> Path depth (>=0).

start — **specified by user, fullword integer**
> Starting member of the list of paths (>=1).

number — **specified by user, fullword integer**
> Number of paths requested (>=0).

buflen — **specified by user, fullword integer**
> Length, in bytes, of the specified data parameter (*data*) (>=0).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> | | |
> |---|---|
> | **12** | FUNCTION REQUIRES STATE SSSL |
> | **122** | STRUCTURE IDENTIFIER DOES NOT EXIST |
> | **538** | START VALUE < ONE |
> | **539** | REQUESTED NUMBER < ZERO |
> | **543** | START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED |
> | **552** | PATH ORDER IS INVALID |
> | **558** | PATH DEPTH < ZERO |
> | **577** | BUFFER LENGTH IS < ZERO |

actnum — **returned by the graPHIGS API, fullword integer**
> Total number of paths returned.

actlen — **returned by the graPHIGS API, fullword integer**
> Total length, in bytes, of the paths returned in the data parameter (*data*).

totnum — **returned by the graPHIGS API, fullword integer**
> Total number of the distinct paths available for the specified structure identifier.

data — **returned by the graPHIGS API, variable data**
> The data buffer into which the paths are to be returned. The format of the data is as follows:

```
                      --------------------
   Start of buffer   |       path 1       |
                     |--------------------|
                     |       path 2       |
                     |--------------------|
                     |                    |
                     Z                    Z
                     |--------------------|
   End of buffer     |       path n       |
                      --------------------
```

> where each path has the following format:

```
                      --------------------
   WORDS   1         |number of items in  |  Fullword integer
                     |  the returned path |
                     |--------------------|
           2         |   structure id 1   |  Fullword integer
                     |--------------------|
           3         |  element number 1  |  Fullword integer
                     |--------------------|
           4         |   structure id 2   |  Fullword integer
                     |--------------------|
           5         |  element number 2  |  Fullword integer
                     |--------------------|
                     |                    |
                     Z                    Z
                     |--------------------|
                     |   structure id m   |  Fullword integer
                     |--------------------|
                     |  element number m  |  Fullword integer
                      --------------------
```

termcond — **returned by the graPHIGS API, fullword integer**
> Termination condition. The list of paths was terminated due to one of the following reasons:

> **1-Count Exhausted**
>> The requested number of paths have been returned.

> **2-Buffer Overflow**
>> The requested number of paths could not be returned because they would not all fit in the area provided. *actnum* contains the actual number returned.

> **3-End of Paths**
>> No more paths exists. This condition supersedes the Count Exhausted condition (if that condition was in effect). Because of this, the total number of paths may or may not be equal to the requested number of paths to be returned. *actnum* should be checked to find the actual number of paths returned.

> **4-Large Path**
>> The next path would not fit into the inbound buffer between the nucleus and the shell. *actnum* contains the number of paths returned excluding the path that would not fit.

GPQPER - Inquire Predefined Edge Representation

GPQPER (*wstype*, *index*, *errind*, *edgefg*, *edgelt*, *edgesf*, *ecol*)

Note: This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQPER** to inquire the predefined settings for the edge attributes in the edge bundle table for the specified workstation type.

The graPHIGS API returns the edge flag setting (*edgefg*), edge line type (*edgelt*), edge scale factor (*edgesf*), and edge color for the predefined edge bundle table (*ecol*). The returned attributes correspond to the requested bundle table index.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
Workstation type.

index — **specified by user, fullword integer**
Predefined edge bundle table index (>=1).

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

23   SPECIFIED WORKSTATION TYPE DOES NOT EXIST

35   WORKSTATION HAS ONLY INPUT CAPABILITIES

43   BUNDLE INDEX EXCEEDS WORKSTATION TABLE CAPACITY

60   BUNDLE INDEX VALUE < ONE

548   SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

edgefg — **returned by the graPHIGS API, fullword integer**
Edge flag corresponding to the specified entry (1=OFF, 2=ON, 3=GEOMETRY_ONLY).

edgelt — **returned by the graPHIGS API, fullword integer**
Line type of an edge corresponding to the specified entry.

edgesf — **returned by the graPHIGS API, short floating-point number**
Edge scale factor corresponding to the specified entry.

ecol — **returned by the graPHIGS API, fullword integer**
    Edge color index corresponding to the specified entry.

GPQPIR - Inquire Predefined Interior Representation

GPQPIR (*wstype*, *index*, *errind*, *style*, *sindex*, *icol*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see "WDT Inquiries."

Purpose

Use **GPQPIR** to inquire the predefined settings for the interior attributes in the interior bundle table for the specified workstation type.

The graPHIGS API returns the interior style (*style*), the style index (*sindex*), and the interior color index for the predefined interior bundle table (*icol*). The returned attributes correspond to the requested bundle table index.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
    Workstation type.

index — **specified by user, fullword integer**
    Predefined interior bundle table index (>=1).

errind — **returned by the graPHIGS API, fullword integer**
    Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

    23   SPECIFIED WORKSTATION TYPE DOES NOT EXIST

    35   WORKSTATION HAS ONLY INPUT CAPABILITIES

    43   BUNDLE INDEX EXCEEDS WORKSTATION TABLE CAPACITY

    60   BUNDLE INDEX VALUE < ONE

    548   SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

style — **returned by the graPHIGS API, fullword integer**
> Interior style corresponding to the specified entry (`1=HOLLOW, 2=SOLID, 3=PATTERN, 4=HATCH, 5=EMPTY`).

sindex — **returned by the graPHIGS API, fullword integer**
> Style index corresponding to the specified entry.

icol — **returned by the graPHIGS API, fullword integer**
> Interior color index corresponding to the specified entry.

GPQPK - Inquire Pick Device State

> **GPQPK (*wsid*, *device*, *type*, *inlen*, *exlen*, *pathlen*, *length*, *errind*, *mode*, *echosw*, *inclen*, *incl*, *exclen*, *excl*, *depth*, *pickpath*, *echo*, *area*, *datalen*, *data*, *order*)**

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQPK** to inquire the current state of the specified pick device attached to a specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 533 (an output parameter is not large enough for all the requested data), then the values up to the length specified are returned. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

device — **specified by user, fullword integer**
> Pick device number.

type — **specified by user, fullword integer**
> Type of returned values (`1=SET`).

inlen — **specified by user, fullword integer**
> Length of inclusion filter array provided by the application for the graPHIGS API to return the corresponding data (>=0).

exlen — **specified by user, fullword integer**
> Length of exclusion filter array provided by the application for the graPHIGS API to return the corresponding data (>=0).

pathlen — **specified by user, fullword integer**

> Length of initial pick path array provided by the application for the graPHIGS API to return the corresponding data.

length — **specified by user, fullword integer**

> Length of pick data record array provided by the application for the graPHIGS API to return the corresponding data.

errind — **returned by the graPHIGS API, fullword integer**

> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> | | |

> | **533** | INQUIRY DATA EXCEEDS AREA. OUTPUT TRUNCATED |
> | **534** | TYPE VALUE IS INVALID |

mode — **returned by the graPHIGS API, fullword integer**

> Current operating mode (1=REQUEST, 2=SAMPLE, 3=EVENT, 4=APPLICATION_DEFINED). The graPHIGS API only returns a mode of 4=APPLICATION_DEFINED if the application set the device mode using the Set Input Device State (**GPIDMO**) subroutine and the mode does not emulate Request, Sample or Event mode.

echosw — **returned by the graPHIGS API, fullword integer**

> Current echo switch (1=NOECHO, 2=ECHO).

inclen — **returned by the graPHIGS API, fullword integer**

> Current inclusion pick filter length.

incl — **returned by the graPHIGS API, array of fullword integers**

> Current inclusion pick filter.

exclen — **returned by the graPHIGS API, fullword integer**

> Current exclusion pick filter length.

excl — **returned by the graPHIGS API, array of fullword integers**

> Current exclusion pick filter.

depth — **returned by the graPHIGS API, fullword integer**

> Current initial pick path depth.

pickpath — **returned by the graPHIGS API, array of fullword integers**

> Current initial pick path.

> The pickpath array contains a list of pickpath entries in row order. Each entry is a triplet consisting of a structure identifier, pick identifier, and element number.

echo — **returned by the graPHIGS API, fullword integer**

> Current prompt/echo type.

area — **returned by the graPHIGS API, 6 short floating-point numbers (DC)**

> Current echo area (Xmin, Xmax, Ymin, Ymax, Zmin, Zmax).

datalen — **returned by the graPHIGS API, fullword integer**

> Current pick data record length.

data — **returned by the graPHIGS API, variable length data**

> Current pick data record.

order **— returned by the graPHIGS API, fullword integer**
　　　Current pick path order (1=TOP_FIRST, 2=BOTTOM_FIRST).

GPQPKA - Inquire Pick Aperture

GPQPKA (*wsid*, *device*, *errind*, *size*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQPKA** to inquire the current size of the pick aperture for the specified pick device on the specified workstation.

The pick aperture is returned as the length of a side of a square in Device Coordinates (DC).

Parameters

wsid **— specified by user, fullword integer**
　　　Workstation identifier.

device **— specified by user, fullword integer**
　　　Pick device number.

errind **— returned by the graPHIGS API, fullword integer**
　　　Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

　　　25　　　SPECIFIED WORKSTATION DOES NOT EXIST

　　　37　　　WORKSTATION IS NOT OF CATEGORY OUTIN

　　　140　　DEVICE NUMBER < ONE OR DEVICE NOT AVAILABLE

size **— returned by the graPHIGS API, short floating-point number (DC)**
　　　Aperture size. This is specified as the length of a side of a square in Device Coordinates (DC).

GPQPKT - Inquire Pick Measure Type

GPQPKT (*wstype*, *device*, *errind*, *type*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQPKT** to determine the type of measure that the pick device supports for the specified workstation type.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
    Workstation type.

device — **specified by user, fullword integer**
    Device number (>=1).

errind — **returned by the graPHIGS API, fullword integer**
    Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

GPQPLF - Inquire Polyline Facilities

GPQPLF (*wstype*, *start*, *number*, *errind*, *ntype*, *ltype*, *nlwidth*, *lwidth*, *minlw*, *maxlw*, *npred*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQPLF** to inquire the polyline facilities for the specified workstation type.

The graPHIGS API returns the total number of available line types and their identifiers (*ntype*[default] the number of available line widths (*nlwidth*) and the nominal (*lwidth*), minimum (*minlw*), and maximum line width size (*maxlw*[default] and the number of predefined polyline bundle table indexes for the specified workstation type (*npred*).

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
    Workstation type.

start — **specified by user, fullword integer**
    Starting member of the list of line types (>=1).

number — **specified by user, fullword integer**
    Number of line types requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
    Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

    23   SPECIFIED WORKSTATION TYPE DOES NOT EXIST

    35   WORKSTATION HAS ONLY INPUT CAPABILITIES

    538   START VALUE < ONE

    539   REQUESTED NUMBER < ZERO

    543   START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

    548   SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

ntype — **returned by the graPHIGS API, fullword integer**
    Total number of available line types.

ltype — **returned by the graPHIGS API, array of fullword integers.**
List of available line types in the workstation's line type table. The table size and specified entries supported are workstation dependent. The default line type table for supported entries is defined with the following line types: (1=SOLID_LINE, 2=DASHED, 3=DOTTED, 4=DASH_DOT, 5=LONG_DASH, 6=DOUBLE_DOT, 7=DASH_DOUBLE_DOT, 8-n=SOLID_LINE). The output array must be large enough to contain the requested data.

nlwidth — **returned by the graPHIGS API, fullword integer**
Number of available line widths. (Zero means that the workstation supports a continuous range of line widths.)

lwidth — **returned by the graPHIGS API, short floating-point number (DC)**
Nominal line width.

minlw — **returned by the graPHIGS API, short floating-point number (DC)**
Minimum line width.

maxlw — **returned by the graPHIGS API, short floating-point number (DC)**
Maximum line width.

npred — **returned by the graPHIGS API, fullword integer**
Number of predefined polyline bundle table entries.

GPQPLR (*wstype*, *index*, *errind*, *ltype*, *lwidth*, *color*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQPLR** to inquire the predefined polyline attributes in an entry of the bundle table for the specified workstation type.

The graPHIGS API returns the polyline type (*ltype*), width (*lwidth*), and color (*color*) for the specified index of the specified workstation type.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
> Workstation type.

index — **specified by user, fullword integer**
> Predefined polyline bundle table index (>=1).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **23**   SPECIFIED WORKSTATION TYPE DOES NOT EXIST

> **35**   WORKSTATION HAS ONLY INPUT CAPABILITIES

> **43**   BUNDLE INDEX EXCEEDS WORKSTATION TABLE CAPACITY

> **60**   BUNDLE INDEX VALUE < ONE

> **548**   SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

ltype — **returned by the graPHIGS API, fullword integer**
> Line type corresponding to the specified entry in the workstation's line type table. The table size and specific entries supported are workstation dependent. The default line type table for supported entries is defined with the following line types: (1=SOLID_LINE, 2=DASHED, 3=DOTTED, 4=DASH_DOT, 5=LONG_DASH, 6=DOUBLE_DOT, 7=DASH_DOUBLE_DOT, 8-n=SOLID_LINE).

lwidth — **returned by the graPHIGS API, short floating-point number**
> Polyline width scale factor corresponding to the specified entry.

color — **returned by the graPHIGS API, fullword integer**
> Polyline color index corresponding to the specified entry.

GPQPMF - Inquire Polymarker Facilities

GPQPMF (*wstype*, *start*, *number*, *errind*, *ntype*, *mtype*, *nsize*, *size*, *minms*, *maxms*, *npred*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQPMF** to inquire the polymarker facilities for the specified workstation type.

The graPHIGS API returns data indicating the total number of available marker types and their identifiers (*ntype*[default] the nominal (*size*), minimum (*minms*), and maximum (*maxms*) marker sizes; and the

number of predefined polymarker bundle table indexes for the specified workstation type (*npred*). If the number of available marker sizes is returned as zero, then the workstation supports a continuous range of marker sizes.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
Workstation type.

start — **specified by user, fullword integer**
Starting member of the list of marker types (>=1).

number — **specified by user, fullword integer**
Number of polymarker types requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

23	SPECIFIED WORKSTATION TYPE DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
538	START VALUE < ONE
539	REQUESTED NUMBER < ZERO
543	START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED
548	SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

ntype — **returned by the graPHIGS API, fullword integer**
Total number of available marker types.

mtype — **returned by the graPHIGS API, array of fullword integers.**
List of available maker types in the workstation's available marker type table. The table size and specific entries supported are workstation dependent. The default marker type table for supported entries is defined with the following marker types: (1=DOT, 2=PLUS_SIGN, 3=ASTERISK, 4=CIRCLE, 5=DIAGONAL_CROSS, 6-n=ASTERISK).

nsize — **returned by the graPHIGS API, fullword integer**
Number of available marker sizes. Zero means that the workstation supports a continuous range of marker sizes.

size — **returned by the graPHIGS API, short floating-point number (DC)**
Nominal marker size.

minms — **returned by the graPHIGS API, short floating-point number (DC)**
Minimum marker size.

maxms — **returned by the graPHIGS API, short floating-point number (DC)**
Maximum marker size.

npred — **returned by the graPHIGS API, fullword integer**
Number of predefined polymarker bundle table entries.

GPQPMR - Inquire Predefined Polymarker Representation

GPQPMR (*wstype*, *index*, *errind*, *mtype*, *msize*, *color*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQPMR** to inquire the predefined polymarker attributes corresponding to the specified entry in the predefined bundle table for the specified workstation type.

The graPHIGS API returns the polymarker type (*mtype*), size (*msize*), and color (*color*) for the specified index of the specified workstation type.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
> Workstation type.

index — **specified by user, fullword integer**
> Predefined polymarker bundle table index (>=1).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **23**   SPECIFIED WORKSTATION TYPE DOES NOT EXIST

> **35**   WORKSTATION HAS ONLY INPUT CAPABILITIES

> **43**   BUNDLE INDEX EXCEEDS WORKSTATION TABLE CAPACITY

> **60**   BUNDLE INDEX VALUE < ONE

> **548**   SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

mtype — **returned by the graPHIGS API, fullword integer**
> Marker type corresponding to the specified entry in the workstation's marker type table. The table size and specific entries supported are workstation dependent. The default marker type table for supported entries is defined with the following marker types: (1=DOT, 2=PLUS_SIGN, 3=ASTERISK, 4=CIRCLE, 5=DIAGONAL_CROSS, 6-n=ASTERISK).

msize — **returned by the graPHIGS API, short floating-point number**
    Marker size scale factor corresponding to the specified entry in the polymarker bundle table.

color — **returned by the graPHIGS API, fullword integer**
    Polymarker color index corresponding to the specified entry in the polymarker bundle table.

GPQPO - Inquire Available Pixel Operations

GPQPO (*ncid*, *type*, *start*, *number*, *errind*, *totnum*, *op*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQPO** to inquire the available pixel operations on the specified nucleus.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

ncid — **specified by user, fullword integer**
    Nucleus identifier.

type — **specified by user, fullword integer**
    Type of pixel operations (`1=TWO_OPERAND`, `2=THREE_OPERAND`).

start — **specified by user, fullword integer**
    Starting member in the list of available operations (>=1).

number — **specified by user, fullword integer**
    Number of pixel operation entries requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
    Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

    202   SPECIFIED NUCLEUS DOES NOT EXIST

    295   PIXEL OPERATION TYPE IS INVALID

    538   START VALUE < ONE

539 REQUESTED NUMBER < ZERO

543 START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

totnum — **returned by the graPHIGS API, fullword integer**
    Total number of available operand pixel operations.

op — **returned by the graPHIGS API, array of fullword integers**
    List of available operations.

GPQPPR - Inquire Predefined Pattern Representation

GPQPPR (*wstype*, *index*, *maxrow*, *maxcol*, *errind*, *drow*, *dcol*, *array*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQPPR** to inquire a predefined pattern table entry for the specified workstation type.

For the specified workstation type, this inquiry returns the values corresponding to the specified index of the predefined pattern table. The graPHIGS API returns the number of pattern array rows (*drow*) and columns (*dcol*), and the array of color indexes corresponding to the pattern (*array*).

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 533 (an output parameter is not large enough for all the requested data), then the values up to the length specified are returned. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
    Workstation type.

index — **specified by user, fullword integer**
    Pattern table index (>=1).

maxrow — **specified by user, fullword integer**
    Maximum number of requested pattern array rows (>=1).

maxcol — **specified by user, fullword integer**
    Maximum number of requested pattern array columns (>=1)

The parameters *maxrow* and *maxcol* define the dimensions of the application's output area *array*
Using these values, the graPHIGS API either fills in or truncates the output information, as
appropriate.

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of
the following errors exists:

23   SPECIFIED WORKSTATION TYPE DOES NOT EXIST

35   WORKSTATION HAS ONLY INPUT CAPABILITIES

48   PATTERN INDEX EXCEEDS WORKSTATION TABLE CAPACITY

85   PATTERN INDEX VALUE < ONE

90   INTERIOR STYLE NOT SUPPORTED ON WORKSTATION

91   STARTING POINT OR DIMENSION < ONE

533   INQUIRY DATA EXCEEDS AREA. OUTPUT TRUNCATED

548   SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

drow — **returned by the graPHIGS API, fullword integer**
Total number of pattern array rows in the entry specified.

dcol — **returned by the graPHIGS API, fullword integer**
Total number of pattern array columns in the entry specified.

The output parameters *drow* and *dcol* identify the actual size of the requested pattern entry.
Depending on the values of *maxrow* and *maxcol*, these may or may not match the amount of data
actually placed in the output area.

array — **returned by the graPHIGS API, array of fullword integers**
Pattern array of color indexes in row order. The pattern array of color indexes is returned within
the array bounds specified by *maxrow* and *maxcol*. Each pattern row is returned in the
corresponding row of *array* beginning in column 1. The high numbered rows and columns of the
returned pattern are omitted as necessary to fit the number of rows and columns specified for
array by *maxrow* and *maxcol*. Error indicator 533 is set in this case. If either dimension of the
pattern is smaller than the dimension of *array*, then the unused elements contain unpredictable
values.

GPQPTR - Inquire Predefined Text Representation

GPQPTR (*wstype*, *index*, *errind*, *font*, *prec*, *factor*, *space*, *color*)

Note: This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQPTR** to inquire a set of predefined text attributes as set in the text bundle table for the specified workstation type.

The graPHIGS API returns the requested index for text font (*font*) and precision (*prec*), character expansion factor (*factor*), character spacing (*space*), and text color (*color*) for the specified entry.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
    Workstation type.

index — **specified by user, fullword integer**
    Predefined text bundle table index (>=1).

errind — **returned by the graPHIGS API, fullword integer**
    Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

23	SPECIFIED WORKSTATION TYPE DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
43	BUNDLE INDEX EXCEEDS WORKSTATION TABLE CAPACITY
60	BUNDLE INDEX VALUE < ONE
548	SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

font — **returned by the graPHIGS API, fullword integer**
    Text font corresponding to the specified entry.

prec — **returned by the graPHIGS API, fullword integer**
    Text precision corresponding to the specified entry (1=STRING_PREC, 2=CHAR_PREC, 3=STROKE_PREC).

factor — **returned by the graPHIGS API, short floating-point number**
    Character expansion factor corresponding to the specified entry (the deviation of the width-to-height ratio of the font).

space — **returned by graPHIGS API, short floating-point number**
    Character spacing corresponding to the specified entry, which is specified as a fraction of the font-nominal character height.

color — **returned by the graPHIGS API, fullword integer**
    Text color index corresponding to the specified entry.

GPQRCM - Inquire Available Rendering Color Models

GPQRCM (*wstype*, *start*, *number*, *errind*, *totnum*, *model*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQRCM** to inquire a list of available rendering color models for the specified workstation type.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
    Workstation type.

start — **specified by user, fullword integer**
    Starting member of the list of available rendering color models (>=1).

number — **specified by user, fullword integer**
    Number of rendering color models requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
    Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

    23   SPECIFIED WORKSTATION TYPE DOES NOT EXIST

    35   WORKSTATION HAS ONLY INPUT CAPABILITIES

    538   START VALUE < ONE

    539   REQUESTED NUMBER < ZERO

    543   START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

    548   SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

totnum — **returned by the graPHIGS API, fullword integer**
    Total number of available rendering color models.

model — **returned by the graPHIGS API, array of fullword integers**
    List of rendering color models (`1=RGB_NORMAL`, `2=RGB_B_ONLY`).

GPQRCT - Inquire Realized Connection and Type

GPQRCT (*wsid*, *ilen*, *errind*, *olen*, *connid*, *wstype*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQRCT** to inquire the connection identifier and the realized workstation type of the specified workstation identifier. When you create a workstation using the Open Workstation (**GPOPWS**) subroutine, or the Create Workstation (**GPCRWS**) subroutine, the graPHIGS API assigns a workstation type. This type is the realized workstation type.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 536 (the actual connection identifier is greater than the length of the area provided), then only the actual length (*olen*) of the connection identifier is returned. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

ilen — **specified by user, fullword integer**
> Length of the area provided to contain the connection identifier.

errind — **returned by the graPHIGS API fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:
>
> **25**   SPECIFIED WORKSTATION DOES NOT EXIST
>
> **536**   INQUIRY DATA EXCEEDS AREA. LENGTH OF REQUIRED AREA RETURNED

olen — **returned to user, fullword integer**
> Actual length of the connection identifier.

connid — **returned by the graPHIGS API variable length character string**
> Connection identifier.

wstype — **returned by the graPHIGS API 8-byte character string**
> Realized workstation type.

GPQRST - Inquire Referencing Structures

GPQRST (*strid*, *start*, *number*, *errind*, *totnum*, *istrid*)

> **Note:** This subroutine is a Structure State List (SSL) inquiry. For an overview, see ″SSL Inquiries.″

Purpose

Use **GPQRST** to inquire a list of identifiers of structures that contain execute structure-type elements (execute structure elements and conditional execute structure elements) that reference the specified structure.

A structure identifier can be in the list once for every execute structure-type element that it contains that references the specified structure.

If the inquired information is available, the error indicator is returned as zero, and the values are returned in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number parameter is set. If the inquired information is unavailable, the error indicator contains an error number indicating the reason and the values returned in the output parameters are unpredictable.

Parameters

strid — **specified by user, fullword integer**
Structure identifier.

start — **specified by user, fullword integer**
The starting member of the list of structure identifiers (>=1).

number — **specified by user, fullword integer**
Number of entries requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

12	FUNCTION REQUIRES STATE SSSL
122	STRUCTURE IDENTIFIER DOES NOT EXIST
538	START VALUE < ONE
539	REQUESTED NUMBER < ZERO
543	START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

totnum — **returned by the graPHIGS API, fullword integer**
        Total number of referencing structures.

istrid — **returned by the graPHIGS API, array of fullword integers**
        List of structure identifiers that reference the specified structure.

GPQRV (*wsid*, *view*, *start*, *number*, *errind*, *totnum*, *strid*, *priority*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQRV** to inquire a list of the root structure identifiers associated with the specified view.

Structure identifiers returned by this subroutine are those in the structure store associated with the view.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
        Workstation identifier.

view — **specified by user, fullword integer**
        View index (>=0).

start — **specified by user, fullword integer**
        Starting member of the list of structure identifiers (>=1).

number — **specified by user, fullword integer**
        Number of structure identifiers requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
        Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

>   **25**   SPECIFIED WORKSTATION DOES NOT EXIST

>   **35**   WORKSTATION HAS ONLY INPUT CAPABILITIES

59	VIEW INDEX VALUE < ZERO

GPQRVR - Inquire Requested View Representation

GPQRVR (*wsid*, *view*, *number*, *ids*, *errind*, *data*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQRVR** to inquire one or more fields from the specified requested view table entry.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. The output parameter must be large enough to store all requested data.

If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

view — **specified by user, fullword integer**
> View index (>=0).

number — **specified by user, fullword integer**
> Number of groups requested (>=1).

ids — **specified by user, array of fullword integers**
> A list of group identifiers.

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

```

Group Identifier 8 - Reserved

This field is reserved.

Group Identifier 9 - Temporary view indicator

A fullword integer (1=OFF, 2=ON)

Group Identifier 10 - HLHSR mode

A fullword integer (1=OFF, 2=ON_THE_FLY)

Group Identifier 11 - Transparency processing mode

A fullword integer (1=OFF, 2=PARTIAL_TRANSPARENT, 3=BLEND, 4=BLEND_ALL)

Group Identifier 12 - Initial color processing mode index

A fullword integer (>=0)

Group Identifier 13 - Initial frame buffer write protect mask

A 32-bit bit string.

Group Identifier 14 - Viewport, 2D form

4 short floating-point numbers (including only Xmin, Xmax, Ymin, Ymax). For the set subroutine, Zmin and Zmax are set to their default values.

Group Identifier 15 - Viewport, 3D form

6 short floating-point numbers (Xmin, Xmax, Ymin, Ymax, Zmin, Zmax)

Group Identifier 16 - View volume, 2D form

4 short floating-point numbers specifying the view window (Umin, Umax, Vmin, Vmax). For the set subroutine, other fields of the view volume group are set to their default values.

Group Identifier 17 - View volume, 3D form

10 short floating-point numbers and a fullword integer specifying a view window (Umin,Umax,Vmin,Vmax), near plane distance, far plane distance, projection reference point (u, v, n), view plane distance and a projection type (1=PARALLEL, 2=PERSPECTIVE).

```
        ----------------------
        |        Umin        |  short floating-point number
        |--------------------|
```

```
        Umax       │ short floating-point number
--------------------
        Vmin       │ short floating-point number
--------------------
        Vmax       │ short floating-point number
--------------------
 near plane distance│ short floating-point number
--------------------
  far plane distance│ short floating-point number
--------------------
    U projection-   │ short floating-point number
   reference point
--------------------
    V projection-   │ short floating-point number
   reference point
--------------------
    N projection-   │ short floating-point number
   reference point
--------------------
 view plane distance│ short floating-point number
--------------------
   projection type  │ fullword integer
--------------------
```

Group Identifier 18 - View matrix, 2D form

9 short floating-point numbers. For the output matrix, the elements are in the following order:

```
|m11  m12  m14|
|m21  m22  m24|--->(m11,m12,m14,m21.....m44)
|m41  m42  m44|
```

The output 3[default]3 matrix is extracted by the graPHIGS API from the 4[default]4 matrix of the three-dimensional form:

```
|m11  m12  m13  m14|
|m21  m22  m23  m24|--->(m11,m12,m13,m14,m21,m22.....m44)
|m31  m32  m33  m34|
|m41  m42  m43  m44|
```

Group Identifier 19 - View matrix, 3D form

16 short floating-point numbers, M11, M12, M13. For the output view matrix, the elements are in the following order:

```
|m11  m12  m13  m14|
|m21  m22  m23  m24|--->(m11,m12,m13,m14,m21,m22.....m44)
|m31  m32  m33  m34|
|m41  m42  m43  m44|
```

Group Identifier 20 - View input active flag

A fullword integer (1=INACTIVE, 2=ACTIVE)

Group Identifier 21 - View output active flag

A fullword integer (1=INACTIVE, 2=ACTIVE)

Group Identifier 22 - View mapping matrix, 2D form

9 short floating-point numbers:

```
|m11  m12  m14|
|m21  m22  m24|--->(m11,m12,m14,m21.....m44)
|m41  m42  m44|
```

Group Identifier 23 - View mapping matrix, 3D

16 short floating-point numbers:

```
|m11  m12  m13  m14|
|m21  m22  m23  m24|--->(m11,m12,m13,m14,m21,m22.....m44)
|m31  m32  m33  m34|
|m41  m42  m43  m44|
```

Group Identifier 24 - Antialiasing mode
A fullword integer (1=OFF, 2=SUBPIXEL_ON_THE_FLY, 3=NON_SUBPIXEL_ON_THE_FLY)

Group Identifier 25 - Shield alpha value
A fullword integer (0<=$alpha$<=255)

GPQSDF - Inquire Surface Display Facilities

GPQSDF (*wstype*, *start*, *number*, *errind*, *order*, *totnum*, *criteria*)

Note: This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQSDF** to inquire the surface facilities for the specified workstation type.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
Workstation type.

start — **specified by user, fullword integer**
> Starting member of the list of available surface approximation criteria (>=1).

number — **specified by user, fullword integer**
> Number of surface approximation criteria requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **23**   SPECIFIED WORKSTATION TYPE DOES NOT EXIST

> **35**   WORKSTATION HAS ONLY INPUT CAPABILITIES

> **538**   START VALUE < ONE

> **539**   REQUESTED NUMBER < ZERO

> **543**   START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

> **548**   SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

order — **returned by the graPHIGS API, fullword integer**
> Maximum surface order supported.

totnum — **returned by the graPHIGS API, fullword integer**
> Total number of available surface approximation criteria.

criteria — **returned by the graPHIGS API, array of fullword integers**
> List of surface approximation criteria (1=`WORKSTATION_DEPENDENT`,
> 3=`CONSTANT_SUBDIVISION_BETWEEN_KNOTS`, 8=`VARIABLE_SUBDIVISION_BETWEEN_KNOTS`).

GPQSEV - Inquire More Simultaneous Events

GPQSEV (*simevnt*)

Note: This subroutine is a State List (PSL) inquiry. For an overview, see ″PSL Inquiries.″

Purpose

Use **GPQSEV** to inquire whether additional simultaneous events are waiting in the input queue.

The graPHIGS API returns a value indicating that additional events are waiting that occurred from the same device trigger as the event previously in the current event report (CEV).

This subroutine can be called after the appropriate Get subroutine was used to remove the previous event from the CEV.

Parameters

simevnt — **returned by the graPHIGS API, fullword integer**
    More simultaneous events (`1=NOMORE`, `2=MORE`).

GPQSH - Inquire Shell Identifier

GPQSH (*ncid*, *errind*, *shid*, *env*)

> **Note:** This subroutine is a State List (PSL) inquiry. For an overview, see *"PSL Inquiries."*

Purpose

Use **GPQSH** to inquire your application's shell identifier on the specified nucleus and its environment descriptor. The descriptor contains information about the environment for the application process issuing the inquiry.

If this application process is communicating with another application process in a different environment, and it passes data to that application process, or it receives data from that application process, it may need to convert the data to a form that will be recognized by the application process using the data. The differences in data in different environments could be:

- character encoding can be EBCDIC or ASCII
- floating-point format can be IBM single precision or IEEE single precision
- the byte order of data can be swapped

The Convert Data (**GPCVD**) subroutine allows you to convert data by specifying an environment descriptor and origin parameter to a form that another application process can use.

An application process may pass its environment descriptor to another application process by issuing the Send Broadcast Message (**GPSBMS**) subroutine, or Send Private Message (**GPSPMS**) subroutine.

If the inquired information is available, the error indicator is returned as zero, and the values are returned in the output parameters. If the inquired information is unavailable, the error indicator contains an error number indicating the reason and the values returned in the output parameters are unpredictable.

Parameters

ncid — **specified by user, fullword integer**
    Nucleus identifier.

errind — **returned by the graPHIGS API, fullword integer**

Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

202 SPECIFIED NUCLEUS DOES NOT EXIST

shid — **returned by the graPHIGS API, fullword integer**

Shell identifier.

env — **returned by the graPHIGS API, 4-byte character string**

Environment descriptor.

GPQSHD - Inquire Shell Deferral State

GPQSHD (*deferral*, *update*)

Note: This subroutine is a State List (PSL) inquiry. For an overview, see ″PSL Inquiries.″

Purpose

Use **GPQSHD** to inquire the current shell deferral state values.

Parameters

deferral — **returned by the graPHIGS API, fullword integer**

Shell deferral mode (1=FLUSH, 2=DEFERRED, 3 DEFERRED_PLUS_MSGS).

update — **returned by the graPHIGS API, fullword integer**

Update notification mode (1=NO, 2=YES).

Error Codes

GPQSID - Inquire List of Socket Identifiers

GPQSID (*start*, *number*, *errind*, *totnum*, *socketids*)

Purpose

Use **GPQSID** to inquire the currently existing socket identifiers in use by the graPHIGS API and available to the graPHIGS shell. This inquiry is intended for applications that use the graPHIGS SYNCPROC default. See *The graPHIGS Programming Interface: Technical Reference* for further information on the SYNCPROC default and the ramifications of its use.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (totnum) parameter is set. If the inquired information is unavailable, then the error indicator (errind) contains an error number indicating the reason, and the values returned in the output parameters are unpredicatable.

Parameters

start — **specified by user, fullword integer**
    Starting member of the list of socket identifiers (>=1).

number — **specified by user, fullword integer**
    Number of entries requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
    Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

    538   START VALUE < ONE

    539   REQUESTED NUMBER < ZERO

    543   STARTS EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

totnum — **returned by the graPHIGS API, fullword integer**
    Total number of socket identifiers in list.

socketids — **returned by the graPHIGS API, array of fullword integers**
    List of socket identifiers.

GPQSK - Inquire Stroke Device State

GPQSK (*wsid*, *device*, *type*, *lenpts*, *length*, *errind*, *mode*, *echosw*, *view*, *npoint*, *pointarray*, *echo*, *area*, *buflen*, *editpos*, *datalen*, *data*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQSK** to inquire the current state of a stroke device attached to the specified workstation.

The graPHIGS API returns the current values for the specified device.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 533 (an output parameter is not large enough for all the requested data), then the values up to the length specified are returned. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
 Workstation identifier.

device — **specified by user, fullword integer**
 Stroke device number (>=1).

type — **specified by user, fullword integer**
 Type of returned values (1=SET).

lenpts — **specified by user, fullword integer**
 Length of initial stroke points array, in points, provided by the application for the graPHIGS API to return corresponding data.

length — **specified by user, fullword integer**
 Length of requested stroke data array provided by the application for the graPHIGS API to return corresponding data.

errind — **returned by the graPHIGS API, fullword integer**
 Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **25** SPECIFIED WORKSTATION DOES NOT EXIST
>
> **38** WORKSTATION HAS ONLY OUTPUT CAPABILITIES
>
> **140** DEVICE NUMBER < ONE OR DEVICE NOT AVAILABLE
>
> **509** DATA LENGTH VALUE < ZERO OR REQUIRED LENGTH
>
> **533** INQUIRY DATA EXCEEDS AREA. OUTPUT TRUNCATED
>
> **534** TYPE VALUE IS INVALID

mode — **returned by the graPHIGS API, fullword integer**
 Current operating mode (1=REQUEST, 2=SAMPLE, 3=EVENT, 4=APPLICATION_DEFINED). The graPHIGS

API only returns a mode of 4=APPLICATION_DEFINED if the application set the device mode using the Set Input Device State (**GPIDMO**) subroutine and the mode does not emulate Request, Sample, or Event mode.

echosw — **returned by the graPHIGS API, fullword integer**
Current echo switch (1=NOECHO, 2=ECHO).

view — **returned by the graPHIGS API, fullword integer**
Current initial view index.

npoint — **returned by the graPHIGS API, fullword integer**
Current number of points in the initial stroke.

pointarray — **returned by the graPHIGS API, array of short floating-point numbers (WC)**
Current coordinates of initial points in stroke. Array is formatted as a list of points in row order.

echo — **returned by the graPHIGS API, fullword integer**
Current prompt/echo type.

area — **returned by the graPHIGS API, 6 short floating-point numbers (DC)**
Current echo area (Xmin, Xmax, Ymin, Ymax, Zmin, Zmax).

buflen — **returned by the graPHIGS API, fullword integer**
Current stroke input buffer size in points.

editpos — **returned by the graPHIGS API, fullword integer**
Current editing position.

datalen — **returned by the graPHIGS API, fullword integer**
Current stroke data record length in bytes.

data — **returned by the graPHIGS API, variable length data**
Current stroke data record.

GPQSPD - Inquire Source Physical Device

GPQSPD (*wstype*, *class*, *ldevice*, *errind*, *category*, *pdevice*)

Note: This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQSPD** to inquire the category and number of the physical device that is connected to the specified logical input device.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
      Workstation type.

class - **specified by user, fullword integer**
      Logical input device class (`1=LOCATOR, 2=STROKE, 3=VALUATOR, 4=CHOICE, 5=PICK, 6=STRING`).

ldevice - **specified by user, fullword integer**
      Logical device number (>=1).

errind — **returned by the graPHIGS API, fullword integer**
      Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

      23   SPECIFIED WORKSTATION TYPE DOES NOT EXIST

      38   WORKSTATION HAS ONLY OUTPUT CAPABILITIES

      140   DEVICE NUMBER < ONE OR DEVICE NOT AVAILABLE

      328   INPUT CLASS VALUE IS INVALID

      548   SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

category — **returned by the graPHIGS API, fullword integer**
      Physical device category (`1=BUTTON, 2=SCALAR, 3=2D_VECTOR`).

pdevice — **returned by the graPHIGS API, fullword integer**
      Physical device number.

GPQSPL - Inquire Shell Product Level

GPQSPL (*level*)

Note: This subroutine is a State List (PSL) inquiry. For an overview, see ″PSL Inquiries.″

Purpose

Use **GPQSPL** to obtain the product level of the shell that the application is using.

The information that is returned will be an array of 3 fullword integers containing the product level information of the shell which consists of:

- Version level
- Release level
- Modification level.

Parameters

level **— returned by the graPHIGS API, 3 fullword integers**
    The information returned will be the Version, Release, and Modification level of the shell that the application is using.

GPQSSS - Inquire Selected Structure Store

GPQSSS (*status*, *ssid*)

> **Note:** This subroutine is a State List (PSL) inquiry. For an overview, see ″PSL Inquiries.″

Purpose

Use **GPQSSS** to inquire the currently selected structure store.

If the selected structure store exists, the graPHIGS API returns value 2=EXISTENT to the *status* parameter and the structure store identifier to the second parameter. If the selected structure store does not exist, the graPHIGS API returns value 1=NON_EXISTENT to the *status* parameter and the second parameter is not set.

Parameters

status **— returned by the graPHIGS API, fullword integer**
    Selected structure store status (1=NON_EXISTENT, 2=EXISTENT).

ssid **— returned by the graPHIGS API, fullword integer**
    Structure store identifier.

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQST** to inquire the current state of a string device attached to the specified workstation.

The graPHIGS API returns the current values of the specified device.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 533 (an output parameter is not large enough for all the requested data), then the values up to the length specified are returned. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
    Workstation identifier.

device — **specified by user, fullword integer**
    String device number (>=1).

type — **specified by user, fullword integer**
    Type of returned values (1=SET).

slen — **specified by user, fullword integer**
    Length of the current initial string array, in bytes, provided by the application for the graPHIGS API to return corresponding data.

length — **specified by user, fullword integer**
    Length of requested string data record array, in bytes, provided by the application for the graPHIGS API to return corresponding data.

errind — **returned by the graPHIGS API, fullword integer**
    Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

    25   SPECIFIED WORKSTATION DOES NOT EXIST

    38   WORKSTATION HAS ONLY OUTPUT CAPABILITIES

    140   DEVICE NUMBER < ONE OR DEVICE NOT AVAILABLE

    509   DATA LENGTH VALUE < ZERO OR REQUIRED LENGTH

    533   INQUIRY DATA EXCEEDS AREA. OUTPUT TRUNCATED

    534   TYPE VALUE IS INVALID

mode — **returned by the graPHIGS API, fullword integer**

> Current operating mode (`1=REQUEST`, `2=SAMPLE`, `3=EVENT`, `4=APPLICATION_DEFINED`). The graPHIGS API only returns a mode of `4=APPLICATION_DEFINED` if the application set the device mode using the Set Input Device State (**GPIDMO**) subroutine and the mode does not emulate Request, Sample, or Event mode.

echosw — **returned by the graPHIGS API, fullword integer**

> Current echo switch (`1=NOECHO`, `2=ECHO`).

GPQSTI - Inquire Structure Identifiers

GPQSTI (*start*, *number*, *errind*, *totnum*, *lstrid*)

Note: This subroutine is a Structure State List (SSL) inquiry. For an overview, see ″SSL Inquiries.″

Purpose

Use **GPQSTI** to inquire the currently existing structure identifiers in the currently selected structure store.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

start — **specified by user, fullword integer**
> Starting member of the list of structure identifier (>=1).

number — **specified by user, fullword integer**
> Number of entries requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

GPQSTV - Inquire Structure State Value

GPQSTV (*state*)

> **Note:** This subroutine is a State List (PSL) inquiry. For an overview, see ″PSL Inquiries.″

Purpose

Use **GPQSTV** to inquire the structure store state of the graPHIGS API.

The structure state has one of the following values and meanings:

1=STCL A structure store is selected but no structure is open.

2=STOP A structure store is selected and a structure is open.

3=SSCL No structure store is attached to the graPHIGS API shell.

4=SSOP At least one structure store is attached to the graPHIGS API shell but no structure store is selected.

5=NROP The Begin Structure sequence has been started.

Parameters

state — **returned by the graPHIGS API, fullword integer**
> Structure state value (1=STCL, 2=STOP, 3=SSCL, 4=SSOP, 5=NROP).

Error Codes

None

GPQSYV - Inquire System State Value

GPQSYV (*state*)

> **Note:** This subroutine is a State List (PSL) inquiry. For an overview, see ″PSL Inquiries.″

Purpose

Use **GPQSYV** to inquire the system state of the graPHIGS API.

Parameters

state **— returned by the graPHIGS API, fullword integer**
System state value (`1=CLOSED`, `2=OPEN`).

Error Codes

None

GPQTDF - Inquire Trimming Curve Display Facilities

GPQTDF (*wstype*, *start*, *number*, *errind*, *order*, *totnum*, *criteria*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQTDF** to inquire the trimming curve facilities for the specified workstation type.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string.**
     Workstation type.

start — **specified by user, fullword integer**
     Starting member of the list of available trimming curve approximation criteria (>=1).

number — **specified by user, fullword integer**
     Number of trimming curve approximation criteria requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
     Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

     23   SPECIFIED WORKSTATION TYPE DOES NOT EXIST

     35   WORKSTATION HAS ONLY INPUT CAPABILITIES

     538   START VALUE < ONE

     539   REQUESTED NUMBER < ZERO

     543   START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

     548   SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

order — **returned by the graPHIGS API, fullword integer**
     Maximum trimming curve order supported.

totnum — **returned by the graPHIGS API, fullword integer**
     Total number of available trimming curve approximation criteria.

criteria — **returned by the graPHIGS API, array of fullword integers**
     List of trimming curve approximation criteria (`1=WORKSTATION_DEPENDENT`, `3=CONSTANT_SUBDIVISION_BETWEEN_KNOTS`, `8=VARIABLE_SUBDIVISION_BETWEEN_KNOTS`).

Error Codes

GPQTMO - Inquire Available Transparency Modes

GPQTMO (*wstype, start, number, errind, totnum, mode*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see "WDT Inquiries."

Purpose

Use **GPQTMO** to inquire the transparency mode facilities for the specified workstation.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
> Workstation type.

start — **specified by user, fullword integer**
> Starting member of the list of available transparency modes (>=1).

number — **specified by user, fullword integer**
> Number of transparency modes requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> | | |
> |---|---|
> | **23** | SPECIFIED WORKSTATION TYPE DOES NOT EXIST |
> | **35** | WORKSTATION HAS ONLY INPUT CAPABILITIES |
> | **538** | START VALUE < ONE |
> | **539** | REQUESTED NUMBER < ZERO |
> | **543** | START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED |
> | **548** | SPECIFIED WORKSTATION TYPE CANNOT BE LOADED |

totnum — **returned by the graPHIGS API, fullword integer**
> Total number of available transparency modes.

mode — **returned by the graPHIGS API, array of fullword integers**
> List of available transparency modes (1=OFF, 2=PARTIAL_TRANSPARENT, 3=BLEND, 4=BLEND_ALL).

GPQVF - Inquire View Facilities

GPQVF (*wstype*, *errind*, *shield*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see "WDT Inquiries."

Purpose

Use **GPQVF** to inquire whether shielding is available for the specified workstation type.

The graPHIGS API returns data indicating whether shielding is available on the specified workstation type.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype **— specified by user, 8-byte character string**
      Workstation type.

errind **— returned by the graPHIGS API, fullword integer**
      Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

>   **23**   SPECIFIED WORKSTATION TYPE DOES NOT EXIST
>
>   **35**   WORKSTATION HAS ONLY INPUT CAPABILITIES
>
>   **548**   SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

shield **— returned by the graPHIGS API, fullword integer**

GPQVL - Inquire Valuator Device State

GPQVL (*wsid, device, type, length, errind, mode, echosw, ivalue, echo, area, lovalue, hivalue, datalen, data*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see *"WSL Inquiries."*

Purpose

Use **GPQVL** to inquire the current state of a valuator device attached to the specified workstation.

The graPHIGS API returns the values of the specified device. The format and content of these values returned by the graPHIGS API depends on the prompt/echo type defined in the subroutine that initializes the input device.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 533 (an output parameter is not large enough for all the requested data), then the values up to the length specified are returned. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
  Workstation identifier.

device — **specified by user, fullword integer**
  Valuator device number (>=1).

type — **specified by user, fullword integer**
  Type of returned values (1=SET).

length — **specified by user, fullword integer**
  Length of requested valuator data array.

errind — **returned by the graPHIGS API, fullword integer**
  Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

  25   SPECIFIED WORKSTATION DOES NOT EXIST

  38   WORKSTATION HAS ONLY OUTPUT CAPABILITIES

  140   DEVICE NUMBER < ONE OR DEVICE NOT AVAILABLE

  509   DATA LENGTH VALUE < ZERO OR REQUIRED LENGTH

  533   INQUIRY DATA EXCEEDS AREA. OUTPUT TRUNCATED

  534   TYPE VALUE IS INVALID

mode — **returned by the graPHIGS API, fullword integer**
  Current operating mode (1=REQUEST, 2=SAMPLE, 3=EVENT, 4=APPLICATION_DEFINED). The graPHIGS API only returns a mode of 4=APPLICATION_DEFINED if the application set the device mode using the Set Input Device State (**GPIDMO**) subroutine and the mode does not emulate Request, Sample, or Event mode.

echosw — **returned by the graPHIGS API, fullword integer**
    Current echo switch (`1=NOECHO, 2=ECHO`).

ivalue — **returned by the graPHIGS API, short floating-point number**
    Current initial value.

echo — **returned by the graPHIGS API, fullword integer**
    Current prompt/echo type.

area — **returned by the graPHIGS API, 6 short floating-point numbers (DC)**
    Current echo area (Xmin, Xmax, Ymin, Ymax, Zmin, Zmax).

lovalue — **returned by the graPHIGS API, short floating-point number**
    Current low end of range for valuator.

hivalue — **returned by the graPHIGS API, short floating-point number**
    Current high end of range for valuator.

datalen — **returned by the graPHIGS API, fullword integer**
    Current valuator data record length.

data — **returned by the graPHIGS API, variable length data**
    Current valuator data record.

GPQVR - Inquire Set of View Which Contain Root

GPQVR (*wsid*, *strid*, *start*, *number*, *errind*, *totnum*, *view*)

Note: This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQVR** to inquire a list of views which contains the specified structure in the currently selected structure store as their roots.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

strid — **specified by user, fullword integer**
Structure identifier.

start — **specified by user, fullword integer**
Starting member of the list of view indexes (>=1).

number — **specified by user, fullword integer**
Number of view indexes requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
122	STRUCTURE IDENTIFIER DOES NOT EXIST
215	SPECIFIED RESOURCES DO NOT EXIST ON THE SAME NUCLEUS
227	STRUCTURE STORE IS NOT SELECTED
538	START VALUE < ONE
539	REQUESTED NUMBER < ZERO
543	START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

totnum — **returned by the graPHIGS API, fullword integer**
Total number of views which contain the root.

view — **returned by the graPHIGS API, array of fullword integers**
List of view indexes which contain the root.

GPQWC - Inquire Workstation Category

GPQWC (*wstype*, *errind*, *type*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQWC** to inquire the category for the specified workstation type.

The graPHIGS API returns the category of the workstation type indicating whether it is `1=OUTPUT` (only), `2=INPUT` (only), `3=OUTIN`.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
> Workstation type.

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **23**   SPECIFIED WORKSTATION TYPE DOES NOT EXIST

> **548**   SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

type — **returned by the graPHIGS API, fullword integer**
> Workstation category (`1=OUTPUT`, `2=INPUT`, `3=OUTIN`).

GPQWD - Inquire Workstation Display Classification

GPQWD (*wstype*, *errind*, *type*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQWD** to inquire the display category for the specified workstation type.

The graPHIGS API returns a value indicating whether the workstation type utilizes vector, raster, or other types of display technology.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
> Workstation type.

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **23**   SPECIFIED WORKSTATION TYPE DOES NOT EXIST

> **548**   SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

type — **returned by the graPHIGS API, fullword integer**
> Display type (1=VECTOR, 2=RASTER, 3=OTHERS).

GPQWDT - Inquire Workstation Description

GPQWDT (*wstype, id, lidata, idata, mlodata, errind, lodata, odata*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see *"WDT Inquiries."*

Purpose

Use **GPQWDT** to inquire particular information from the Workstation Description Table for the specified workstation. The *id* parameter identifies the data that the graPHIGS API returns. Some data types may require additional information in the *idata* parameter.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameters are unpredictable.

The *mlodata* parameter specifies the length of the *odata* output parameter. In general, the length of the *odata* output area must be a certain minimum length. See the parameter descriptions for the required mimimum lengths.

Parameters

wstype **— specified by user, 8-byte character string**
> Workstation type.

id **— specified by user, fullword integer**
> Group identifier. The following identifiers are supported:

> **1:** Modeling Clipping Facilities

> **2:** Transparency Facilities

> **3:** Data Mapping Facilities

> **4:** Text Encoding Facilities

> **5:** Morphing Facilities

lidata **— specified by user, fullword integer**
> Length in bytes of input data area (>= 0).

idata **— specified by user, variable-length data**
> Input data. Depending on the *id* parameter value specified, input data is as follows:

> **1 = Modeling Clipping Facilities**
>> N/A (none required for this type)

> **2 = Transparency Facilities**
>> N/A (none required for this type)

> **3 = Data Mapping Facilities**
>> N/A (none required for this type)

> **4 = Text Encoding Facilities**
>> N/A (none required for this type)

> **5 = Morphing Facilities**
>> N/A (none required for this type)

mlodata **— specified by user, fullword integer**
> Length in bytes of output data area. Depending on the *id* parameter value specified, the *minimum* length value is as follows:

> **1 = Modeling Clipping Facilities**
>> Minimum length value = 8

> **2 = Transparency Facilities**
>> Minimum length value = 16

> **3 = Data Mapping Facilities**
>> Minimum length value = 12

> **4 = Text Encoding Facilities**
>> Minimum length value = 4

> **5 = Morphing Facilities**
>> Minimum length value = 4

errind **— returned by the graPHIGS API, fullword-integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

23   FUNCTION REQUIRES STATE STOP OR NROP (NOT STCL)

272   GROUP IDENTIFIER IS INVALID

509   DATA LENGTH VALUE < ZERO OR REQUIRED LENGTH

533   INQUIRY DATA EXCEEDS AREA. OUTPUT TRUNCATED

548   SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

lodata **— returned by the graPHIGS API, fullword integer**
Length of available output data, in bytes.

odata **— returned by the graPHIGS API, Variable-length data**
Output data. Depending on the *id* parameter value specified, output data is as follows:

1 = Modeling Clipping Facilities
The following data is returned:

```
                    --------------------

GPQWSA - Inquire Set of Workstations to Which Associated

GPQWSA (*strid*, *start*, *number*, *errind*, *totnum*, *lwsid*)

> **Note:** This subroutine is a Structure State List (SSL) inquiry. For an overview, see ″SSL Inquiries.″

Purpose

Use **GPQWSA** to inquire the list of workstations with which the specified structure in the currently selected structure store is associated.

This subroutine returns the number of workstations and list of workstation identifiers with which the specified structure is associated and are attached to the shell. Note that the total number of workstations returned by this subroutine may be less than the actual number of workstations with which the structure is associated, because some of the workstations may not be attached to the shell.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

strid **— specified by user, fullword integer**
> Structure identifier.

start **— specified by user, fullword integer**
> Starting member of the list of workstations (>=1).

number **— specified by user, fullword integer**
> Number of entries requested (>=0).

errind **— returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:
>
> **12**   FUNCTION REQUIRES STATE SSSL
>
> **122**   STRUCTURE IDENTIFIER DOES NOT EXIST

538   START VALUE < ONE

539   REQUESTED NUMBER < ZERO

543   START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

totnum — **returned by the graPHIGS API, fullword integer**
      Total number of workstations to which the structure is associated.

lwsid — **returned by the graPHIGS API, array of fullword integers**
      List of workstation identifiers to which the specified structure is associated.

GPQWSU - Inquire Workstation Storage Utilization

GPQWSU (*wsid*, *errind*, *total*, *lgblock*, *numblks*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQWSU** to inquire information about the utilization of available storage on the specified workstation. This information includes the total number of bytes available (*total*), the largest contiguous block of storage available (*lgblock*), and the number of blocks of storage available (*numblks*).

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
      Workstation identifier.

errind — **returned by the graPHIGS API, fullword integer**
      Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

25   SPECIFIED WORKSTATION DOES NOT EXIST

274   THIS FUNCTION IS NOT SUPPORTED BY THE WORKSTATION

571   INQUIRED INFORMATION IS NOT AVAILABLE

total — **returned by the graPHIGS API, fullword integer**
> Total number of bytes of storage currently available on this workstation.

lgblock — **returned by the graPHIGS API, fullword integer**
> Largest contiguous block of storage available in bytes.

numblks — **returned by the graPHIGS API, fullword integer**
> Number of blocks of storage available.

GPQWSV - Inquire Workstation State Value

GPQWSV (*state*)

> **Note:** This subroutine is a State List (PSL) inquiry. For an overview, see ″PSL Inquiries.″

Purpose

Use **GPQWSV** to inquire the current workstation state of the graPHIGS API.

The graPHIGS API returns a value indicating whether any workstations are open.

Parameters

state — **returned by the graPHIGS API, fullword integer**
> Workstation state value (1=CLOSED, 2=OPEN, 3=SELECTED).

Error Codes

None

GPQWSX - Inquire Workstation Transformation

GPQWSX (wsid, errind, state, rwindow, cwindow, rviewpt, cviewpt)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQWSX** to inquire the current and requested workstation transformation values of a specified workstation.

If your application has not updated the workstation, then the graPHIGS API returns a value of 2=PENDING. In this case, the requested values reflect the settings established in the application with the Set Workstation Transformation 2 (**GPWSX2**) subroutine. The current values reflect the workstation's current transformation values. As soon as the workstation is updated, the requested and current values are the same and the state is 1=NOT_PENDING. The values returned by the graPHIGS API are the window and viewport definitions.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:
>
> **25**   SPECIFIED WORKSTATION DOES NOT EXIST
>
> **35**   WORKSTATION HAS ONLY INPUT CAPABILITIES

state — **returned by the graPHIGS API, fullword integer**
> Workstation transformation update state (1=NOT_PENDING, 2=PENDING).

rwindow — **returned by the graPHIGS API, 6 short floating-point numbers (NPC)**
> Requested workstation window (Xmin, Xmax, Ymin, Ymax, Zmin, Zmax).

cwindow — **returned by the graPHIGS API, 6 short floating-point numbers (NPC)**
> Current workstation window (Xmin, Xmax, Ymin, Ymax, Zmin, Zmax).

rviewpt — **returned by the graPHIGS API, 6 short floating-point numbers (DC)**
> Requested workstation viewport (Xmin, Xmax, Ymin, Ymax, Zmin, Zmax).

cviewpt — **returned by the graPHIGS API, 6 short floating-point numbers (DC)**
> Current workstation viewport (Xmin, Xmax, Ymin, Ymax, Zmin, Zmax).

GPQWTN - Inquire List of Available Workstation Types on Nucleus

GPQWTN (*ncid*, *start*, *number*, *errind*, *maxa*, *totnum*, *wstype*)

>**Note:** This subroutine is a Nucleus Description Table (NDT) inquiry. For an overview, see ″NDT Inquiries.″

Purpose

Use **GPQWTN** to inquire a list of available generic workstation types on the specified nucleus.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

ncid — **specified by user, fullword integer**
>Nucleus identifier.

start — **specified by user, fullword integer**
>Starting member in the list of available generic workstation types (>=1).

number — **specified by user, fullword integer**
>Number of generic workstation types requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
>Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

>| | |
>|---|---|
>| **202** | SPECIFIED NUCLEUS DOES NOT EXIST |
>| **538** | START VALUE < ONE |
>| **539** | REQUESTED NUMBER < ZERO |
>| **543** | START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED |

maxa — **returned by the graPHIGS API, fullword integer**
>Maximum number of workstations to which a structure store can be simultaneously associated.

totnum — **returned by the graPHIGS API, fullword integer**
>Total number of available generic workstation types.

wstype — **returned by the graPHIGS API, array of 8-byte character strings**
> A list of generic workstation types available on the specified nucleus. The output array must be large enough to contain the requested data.

GPQWTO - Inquire Workstation Type and Options

GPQWTO (*wsid*, *ilen*, *errind*, *wstype*, *olen*, *options*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQWTO** to inquire the generic workstation type and workstation creation options that were used to create the specified workstation (*wsid*).

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 536 (the actual creation workstation options are greater than the length of the area provided), then only the actual length (*olen*) of the options is returned. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

ilen — **specified by user, fullword integer**
> Length of the area provided to contain the creation workstation options.

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **25** SPECIFIED WORKSTATION DOES NOT EXIST

> **536** INQUIRY DATA EXCEEDS AREA. LENGTH OF REQUIRED AREA RETURNED
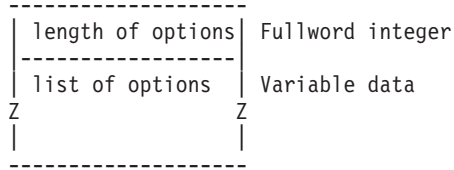

wstype — **returned by the graPHIGS API, 8-byte character string**
> Generic workstation type.

olen — **returned by the graPHIGS API, fullword integer**
> Actual length of the creation workstation options. If the area provided is large enough to contain the options, then the graPHIGS API returns the actual length of the options in this field. This actual

length is the same as the length provided in the first word of the *options* parameter. If the area provided is not large enough to contain the options, then *olen* contains the actual length required and the graPHIGS API sets the error indicator to error 536.

options — **returned by the graPHIGS API, variable data**
Workstation creation options. This parameter has the following format:

```
  --------------------
 │ length of options│ Fullword integer
 │------------------│
 │ list of options  │ Variable data
 Z                  Z
 │  │
  --------------------
```

This format is the same format specified by the Create Workstation (**GPCRWS**) subroutine. See GPCRWS - Create Workstation for this format.

GPQXAF - Inquire Extended Annotation Font Characteristics

GPQXAF (*wsid*, *csid*, *font*, *start*, *num*, *errind*, *prec*, *nomh*, *nahsf*, *lahsf*, *lnfac*, *lmnfac*, *lmxfac*, *proportional*, *top*, *bottom*, *nomaspect*)

Note: This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″
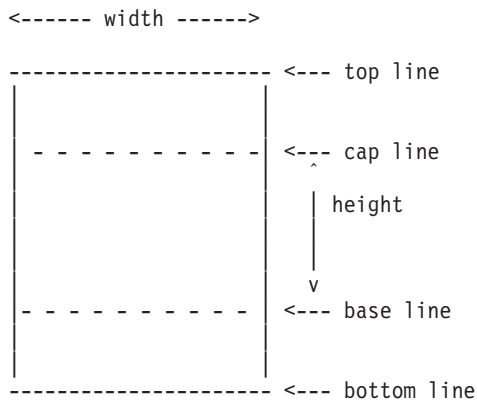

Purpose

Use **GPQXAF** to inquire the annotation text capabilities for the requested character set and font on the specified workstation.

This information consists of the highest text precision for this *csid/font* that is supported by the specified workstation (*prec*), the nominal character height in Device Coordinates (DC) (*nomh*), the number of supported annotation height scale factors (*nahsf*), a list indicating the exact supported height scale factors (*lahsf*), and the number of character expansion factors (*lnfac*), minimum expansion (*lmnfac*) and maximum (*lmxfac*) expansion factors corresponding to each height scale factor, whether the font is fixed or proportional (*proportional*), and ratios describing the character box (*top*, *bottom*, and *nomaspect*).

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Annotation text capabilities are defined in terms of the following character box description:

```
       <------ width ------>

       -------------------- <--- top line
       |                  |
       |                  |
       | - - - - - - - - -| <--- cap line
                          ^
                          |
                          |   height
                          |
                          |
                          v
       | - - - - - - - - -| <--- base line
       |                  |
       |                  |
       -------------------- <--- bottom line
```

Height is defined as the distance between the base line and the cap line.

>   **Note:** The definition of height is different from that used by the Inquire Annotation Font
>   Characteristics (**GPQAFC**) subroutine.

Parameters

wsid **— specified by user, fullword integer**
>   Workstation identifier.

csid **— specified by user, fullword integer**
>   Character set identifier.

font **— specified by user, fullword integer**
>   Font identifier (>=1).

start **— specified by user, fullword integer**
>   Starting member of the list of supported height scale factors (>=1).

num **— specified by user, fullword integer**
>   Number of list elements requested (>=0). This number refers to the number of list elements that
>   are returned.
>
>   >   **Note:** The four output arrays must be large enough to hold the requested number of
>   >   elements.

errind **— returned by the graPHIGS API, fullword integer**
>   Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of
>   the following errors exists:
>
> | | |
> |---|---|
> | **25** | SPECIFIED WORKSTATION DOES NOT EXIST |
> | **35** | WORKSTATION HAS ONLY INPUT CAPABILITIES |
> | **75** | TEXT FONT VALUE IS INVALID |
> | **538** | START VALUE < ONE |
> | **539** | REQUESTED NUMBER < ZERO |
> | **542** | CHARACTER SET IDENTIFIER IS INVALID |
> | **543** | START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED |
> | **562** | CHARACTER SET/FONT COMBINATION IS NOT AVAILABLE FOR ANNOTATION |
> | **571** | INQUIRED INFORMATION IS NOT AVAILABLE |

prec — **returned by the graPHIGS API, fullword integer**
Highest available precision for the corresponding *csid*/*font* (1=STRING_PREC, 2=CHAR_PREC, 3=STROKE_PREC). If the highest precision supported is 3=STROKE_PREC, then the following parameters refer to the workstation's capabilities for character precision with annotation text.

nomh — **returned by the graPHIGS API, short floating-point number (DC)**
The base to cap size, (cap - base), in Device Coordinates (DC) for the nominal height font.

nahsf — **returned by the graPHIGS API, fullword integer**
The total number of annotation sizes that are supported. This also defines the number of entries in each of the next four parameter lists except when this values is zero. A value of zero means that a continuous range of annotation sizes is supported and each of the lists contains two entries.

lahsf — **returned by the graPHIGS API, array of short floating-point numbers**
List of the annotation height scale factors supported. If the device supports a continuous range of annotation heights, then the first entry is 1.0 [default] 10 (-30) and the second is 9.9 [default] 10 (30).

> **Note:** This list has one entry for each annotation size supported. Its length is determined by the *nahsf* field except when that contains 0. In this case, there are two entries in this list. The first entry contains information for the minimum annotation height scale factor. The second contains information for the maximum.

lnfac — **returned by the graPHIGS API, array of fullword integers**
List of numbers of expansion factors that are supported. There is one entry for each of the supported annotation height scale factors. Zero means that a continuous range of expansion factors is supported for the font size.

> **Note:** The length of this list is determined by the *nahsf* field except when that contains 0. In this case, there are two entries in this list. The first entry contains information for the minimum annotation height scale factor. The second contains information for the maximum.

lmnfac — **returned by the graPHIGS API, array of short floating-point numbers**
List of minimum expansion factors that are supported. There is one entry for each of the supported annotation height scale factors. For devices which support all possible expansion factors, this parameter is a very small positive number (e.g.10 (-30)).

> **Note:** The length of this list is determined by the *nahsf* field except when that contains 0. In this case, there are two entries in this list. The first entry contains information for the minimum annotation height scale factor. The second contains information for the maximum.

> **Note:** The expansion factor is computed as follows: expf = (W/H) / *nomaspect* where 'W' and 'H' are the width and the height for that font.

lmxfac — **returned by the graPHIGS API, array of short floating-point numbers.**
List of maximum expansion factors that are supported. There is one entry for each of the supported annotation height scale factors.

> **Note:** For devices which support all possible expansion factors, this parameter contains a very large positive number (e.g. 9.9 [default] 10 (30)).

> **Note:** The length of this list is determined by the *nahsf* field except when this contains 0. In this case, there are two entries in this list. The first entry contains information for the minimum annotation height scale factor. The second contains information for the maximum.

> **Note:** The expansion factor is computed as follows: expf = (W/H) / *nomaspect* where 'W' and 'H' are the width and height for that font.

proportional — **returned by the graPHIGS API, fullword integer**

> Indicates whether the font definition contains per character positioning information so that proportional spacing can be performed (`1=FIXED`, `2=PROPORTIONAL`).

top — **returned by the graPHIGS API, short floating-point number**

> Top ratio, (top-cap)/ *nomh*, is returned in this field (>=0). This is a constant for all sizes of a font.

bottom — **returned by the graPHIGS API, short floating-point number**

> Bottom ratio, (base-bot)/*nomh*, is returned in this field (>=0). This is a constant for all sizes of a font.

nomaspect — **returned by the graPHIGS API, short floating-point number**

> Aspect ratio, (width/height), of the nominal size font.

GPQXCF - Inquire Extended Color Facilities

GPQXCF (*wstype*, *start*, *number*, *errind*, *charact*, *nmax*, *lmax*, *totnum*, *model*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQXCF** to inquire the extended color facilities for the specified workstation.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
> Workstation type.

start — **specified by user, fullword integer**
> Starting member of the list of available color models (>=1).

number — **specified by user, fullword integer**
> Number of color models requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> | | |
> |---|---|
> | **23** | SPECIFIED WORKSTATION TYPE DOES NOT EXIST |
> | **35** | WORKSTATION HAS ONLY INPUT CAPABILITIES |
> | **538** | START VALUE < ONE |
> | **539** | REQUESTED NUMBER < ZERO |
> | **543** | START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED |
> | **548** | SPECIFIED WORKSTATION TYPE CANNOT BE LOADED |

charact — **returned by the graPHIGS API, fullword integer**
> Workstation color table characteristic (1=`NEITHER_MODIFIABLE`, 2=`ONLY_DISPLAY_COLOR_TABLE_MODIFIABLE`, 3=`ONLY_RENDERING_COLOR_TABLE_MODIFIABLE`, 4=`BOTH_MODIFIABLE`).

nmax — **returned by the graPHIGS API, fullword integer**
> Maximum number of definable image color tables.

lmax — **returned by the graPHIGS API, fullword integer**
> Maximum length of definable image color tables.

totnum — **returned by the graPHIGS API, fullword integer**
> Total number of available color models for image color tables.

model — **returned by the graPHIGS API, array of fullword integers**
> List of available color models for image color tables (1=`RGB`, 2=`HSV`, 3=`CMY`, 4=`CIELUV`).

GPQXCR (*wsid*, *ctid*, *start*, *number*, *type*, *errind*, *color*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see *"WSL Inquiries."*

Purpose

Use **GPQXCR** to inquire the current color values in the specified color table of the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

ctid — **specified by user, fullword integer**
> Color table identifier of a color table that exists on the workstation (`-1=DISPLAY_COLOR_TABLE`, `0=RENDERING_COLOR_TABLE`).

start — **specified by user, fullword integer**
> Index specifying an entry into the specified color table to start returning the requested color values (>=0).

number — **specified by user, fullword integer**
> Number of entries requested (>=0).

type — **specified by user, fullword integer**
> Type of returned values (`1=SET`).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

GPQXER - Inquire Extended Edge Representation

GPQXER (*wsid*, *index*, *type*, *number*, *ids*, *errind*, *data*)

Note: This subroutine is a Workstation State List (WSL) inquiry. For an overview, see "WSL Inquiries."

Purpose

Use **GPQXER** to inquire the current value of one or more fields in the specified edge bundle table entry of the specified workstation's edge bundle table.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. The output parameter must be large enough to store all requested data. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
   Workstation identifier.

index — **specified by user, fullword integer**
   Edge bundle table index (>=1).

type — **specified by user, fullword integer**
   Type of returned value (1=SET).

number — **specified by user, fullword integer**
   Number of group identifiers requested (>=1).

ids — **specified by user, array of fullword integers**
   A list of group identifiers requested.

errind — **returned by the graPHIGS API, fullword integer**
   Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

   25   SPECIFIED WORKSTATION DOES NOT EXIST

   35   WORKSTATION HAS ONLY INPUT CAPABILITIES

   43   BUNDLE INDEX EXCEEDS WORKSTATION TABLE CAPACITY

   60   BUNDLE INDEX VALUE < ONE

   272   GROUP IDENTIFIER IS INVALID

   273   NUMBER OF GROUP IDENTIFIERS < ONE

   534   TYPE VALUE IS INVALID

data — **returned by the graPHIGS API, variable data**

Data array containing the values in the requested groups.

The value that may be set for each field is expressed in the data format listed below:

Group Identifier 1 - Edge flag

A fullword integer (1=OFF, 2=ON, 3=GEOMETRY_ONLY).
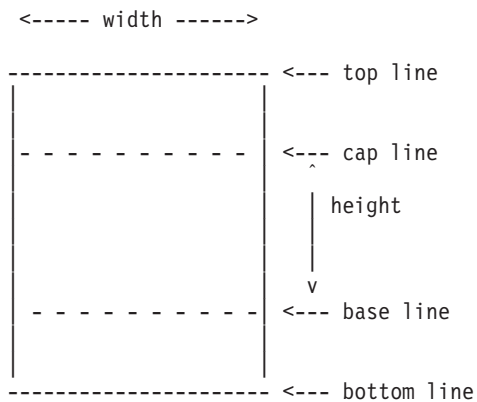

Group Identifier 2 - Line type table index

A fullword integer (>=1). Specifies an index into the workstation's edge line type table. The table size and specified entries supported are workstation dependent. The default edge line type table for supported entries is defined with the following line types: (1=SOLID_LINE, 2=DASHED, 3=DOTTED, 4=DASH_DOT, 5=LONG_DASH, 6=DOUBLE_DOT, 7=DASH_DOUBLE_DOT, 8-n=SOLID_LINE).

Group Identifier 3 - Edge linewidth scale factor

A short floating-point number.

Group Identifier 4 - Edge color

Four fullwords of data with either of the following two formats:

```
        <----- width ------>

        --------------------- <--- top line
        |                   |
        |                   |
        - - - - - - - - - - | <--- cap line
        |                   ^
        |                    |  height
        |                    |
        |                    |
        |                   v
        - - - - - - - - - -| <--- base line
        |                   |
        |                   |

GPQXIR - Inquire Extended Interior Representation

GPQXIR (*wsid*, *index*, *type*, *number*, *ids*, *errind*, *data*)

Note: This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQXIR** to inquire the current values of one or more fields in the specified interior bundle table entry of the specified workstation's interior bundle table.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. The output parameter must be large enough to store all requested data. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

index — **specified by user, fullword integer**
> Interior bundle table index (>=1).

type — **specified by user, fullword integer**
> Type of returned value (1=SET).

number — **specified by user, fullword integer**
> Number of group identifiers requested (>=1).

ids — **specified by user, array of fullword integers**
> A list of group identifiers.

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> | | |
> |---|---|
> | **25** | SPECIFIED WORKSTATION DOES NOT EXIST |
> | **35** | WORKSTATION HAS ONLY INPUT CAPABILITIES |
> | **43** | BUNDLE INDEX EXCEEDS WORKSTATION TABLE CAPACITY |

GPQXLR - Inquire Extended Polyline Representation

GPQXLR (*wsid*, *index*, *type*, *number*, *ids*, *errind*, *data*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see "WSL Inquiries."

Purpose

Use **GPQXLR** to inquire the current values of one or more fields in the specified polyline bundle table entry in the specified workstation's polyline bundle table.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. The output parameter must be large enough to store all requested data. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid **— specified by user, fullword integer**
Workstation identifier.

index **— specified by user, fullword integer**
Polyline bundle table index (>=1).

type **— specified by user, fullword integer**
Type of returned value (`1=SET`).

number **— specified by user, fullword integer**
Number of group identifiers requested (>=1).

ids **— specified by user, array of fullword integers**
A list of group identifiers requested.

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

25 SPECIFIED WORKSTATION DOES NOT EXIST

35 WORKSTATION HAS ONLY INPUT CAPABILITIES

43 BUNDLE INDEX EXCEEDS WORKSTATION TABLE CAPACITY

60 BUNDLE INDEX VALUE < ONE

272 GROUP IDENTIFIER IS INVALID

273 NUMBER OF GROUP IDENTIFIERS < ONE

534 TYPE VALUE IS INVALID

data — **returned by the graPHIGS API, variable data**
Data array containing the values in the requested groups.

The value that may be set for each field is expressed in the data format listed below:
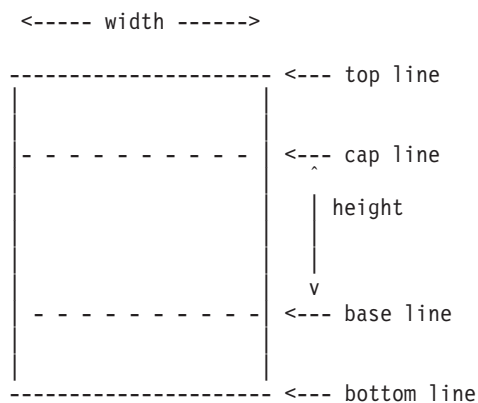

Group Identifier 1 - Line type table index
A fullword integer (>=1). Specifies an index into the workstation's line type table. The table size and specific entries supported is workstation dependent. The default line type table for supported entries is defined with the following line types: (`1=SOLID_LINE`, `2=DASHED`, `3=DOTTED`, `4=DASH_DOT`, `5=LONG_DASH`, `6=DOUBLE_DOT`, `7=DASH_DOUBLE_DOT`, `8-n=SOLID_LINE`).

Group Identifier 2 - Linewidth scale factor
A short floating point number.

Group Identifier 3 - Polyline color
Four fullwords of data with either of the following two formats:

```
        <----- width ------>

     --------------------- <--- top line
    |                     |
    |- - - - - - - - - - -|  <--- cap line
    |                     |   ^
    |                     |   |
    |                     |   | height
    |                     |   |
    |                     |   v
    |- - - - - - - - - - -|  <--- base line
    |                     |
     --------------------- <--- bottom line
```

GPQXMR - Inquire Extended Polymarker Representation

GPQXMR (*wsid*, *index*, *type*, *number*, *ids*, *errind*, *data*)

> **Note:** This subroutine is a Workstation State List (WSL) inquiry. For an overview, see ″WSL Inquiries.″

Purpose

Use **GPQXMR** to inquire the current values of one or more fields in the specified polymarker bundle table entry in the specified workstation's polymarker bundle table.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. The output parameter must be large enough to store all requested data. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

index — **specified by user, fullword integer**
> Polymarker bundle table index (>=1).

type — **specified by user, fullword integer**
> Type of returned value (1=SET).

number — **specified by user, fullword integer**
> Number of group identifiers requested (>=1).

ids — **specified by user, array of fullword integers**
> A list of group identifiers requested.

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> | | |

GPQXTX - Inquire Extended Text Facilities

GPQXTX (*wstype, errind, npred, filled, proportional*)

> **Note:** This subroutine is a Workstation Description Table (WDT) inquiry. For an overview, see ″WDT Inquiries.″

Purpose

Use **GPQXTX** to inquire the extended text facilities for the specified workstation.

If the information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameter. If the inquired information is unavailable, then the error indicator (*errind*) contains the error number indicating the reason, and the values returned in the output parameter are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
    Workstation type.

errind — **returned by the graPHIGS API, fullword integer**
    Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

    23   SPECIFIED WORKSTATION TYPE DOES NOT EXIST

    35   WORKSTATION HAS ONLY INPUT CAPABILITIES

npred — **returned by the graPHIGS API, fullword integer**
    Number of predefined text bundle table entries.

filled — **returned by the graPHIGS API, fullword integer**
    Filled font support (1=NOT_SUPPORTED, 2=SUPPORTED).

proportional — **returned by the graPHIGS API, fullword integer**
    Proportional font support (1=NOT_SUPPORTED, 2=SUPPORTED).

GPRAS - Retrieve Ancestors to Structures

GPRAS (*arid*, *strid*, *order*, *depth*, *start*, *number*, *buflen*, *errind*, *actnum*, *actlen*, *totnum*, *data*, *termcond*)

Note: This subroutine is an Archive inquiry. For an overview, see *"Archive Inquiries."*

Purpose

Use **GPRAS** to retrieve the ancestral paths of a specified structure from the specified open archive file.

A path of ancestors of a structure S is a list of ordered pairs (($A1$, $E1$), ($A2$,$E2$),..., (Am,Em), (S,0)) where each ordered pair consists of an identifier of a structure (Ax) that is an ancestor of the specified structure (S) and the position of an execute structure-type element (Ex) that references the next structure in the path. Ancestor structure $A1$ is the top of the path (e.g., it is not referenced by any other structure) and S is the bottom of the path.

The path order and path depth determine the portion of each path that the graPHIGS API returns. The path depth determines the maximum number of ordered pairs returned in any one path. Specifying a path depth of zero returns each path in its entirety. When truncation occurs, the path order determines whether the graPHIGS API returns the head or tail portion of the path. This truncation can result in two or more portions of paths having the same set of element references. The graPHIGS API returns only one such portion so that all the returned path portions are distinct.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

arid — **specified by user, fullword integer**
Archive file identifier.

strid — **specified by user, fullword integer**
Structure identifier.

order — **specified by user, fullword integer**
Path order (1=TOPFIRST, 2=BOTTOMFIRST).

depth — **specified by user, fullword integer**
> Path depth (>=0).

start — **specified by user, fullword integer**
> Starting member of the list of paths (>=1).

number — **specified by user, fullword integer**
> Number of paths requested (>=0).

buflen — **specified by user, fullword integer**
> Length, in bytes, of the data area specified by the *data* parameter into which the graPHIGS API returns the paths.

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

GPRDS - Retrieve Descendants to Structures

GPRDS (*arid*, *strid*, *order*, *depth*, *start*, *number*, *buflen*, *errind*, *actnum*, *actlen*, *totnum*, *data*, *termcond*)

>**Note:** This subroutine is an Archive inquiry. For an overview, see "Archive Inquiries."

Purpose

Use **GPRDS** to retrieve the descendant paths of a specified structure from the specified open archive file.

A path of descendants of a structure *S* is a list of ordered pairs ((*S, E*0), (*D*1, *E*1) (*D*2, *E*2),..., (*Dn*,0)) where each ordered pair consists of an identifier of a structure (*Dx*) that is a descendant of the specified structure (*S*) and the position of an execute structure-type element (*Ex*) that references the next structure in the path. The specified structure *S* is the top of the path and the descendant structure *Dn* is the bottom of the path (e.g., it does not reference any other structure).

The path order and path depth determine the portion of each path that the graPHIGS API returns. The path depth determines the maximum number of ordered pairs returned in any one path. Specifying a path depth of zero returns each path in its entirety. When truncation occurs, the path order determines whether the graPHIGS API returns the head or tail portion of the path. This truncation can result in two or more portions of paths having the same set of element references. The graPHIGS API returns only one such portion so that all the returned path portions are distinct.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Retrieve Ancestors to Structures

RCP code

201347595 (X'0C00520B')

GPRISN - Retrieve Identifiers of Structures in Network

GPRISN (*arid, strid, start, number, errind, totnum, istrid*)

Note: This subroutine is an Archive inquiry. For an overview, see ″Archive Inquiries.″

Purpose

Use **GPRISN** to retrieve a list of structure identifiers in a specified structure network in the specified open archive file.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

arid — **specified by user, fullword integer**
Archive file identifier.

strid — **specified by user, fullword integer**
Structure identifier of the root structure.

start — **specified by user, fullword integer**
Starting member of the list of structure identifiers (>=1).

number — **specified by user, fullword integer**
Number of entries requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

7	FUNCTION REQUIRES STATE AROP
122	STRUCTURE IDENTIFIER DOES NOT EXIST
220	SPECIFIED ARCHIVE FILE DOES NOT EXIST

538   START VALUE < ONE

539   REQUESTED NUMBER < ZERO

543   START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

totnum — **returned by the graPHIGS API, fullword integer**
> Total number of structures in the specified structure network.

istrid — **returned by the graPHIGS API, fullword integer**
> List of structure identifiers. In a complete list of structure identifiers in the network, the first structure identifier is always the root structure. No structure identifiers are duplicated in the list (e.g., if a structure is referenced in the network more than once, then it only appears once in the list).

GPRSTI - Retrieve Structure Identifiers

GPRSTI (*arid*, *start*, *number*, *errind*, *totnum*, *istrid*)

> **Note:** This subroutine is an Archive inquiry. For an overview, see "Archive Inquiries."

Purpose

Use **GPRSTI** to retrieve a list of structure identifiers in the specified open archive file.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

arid — **specified by user, fullword integer**
> Archive file identifier.

start — **specified by user, fullword integer**
> Starting member of the list of structure identifiers (>=1).

number — **specified by user, fullword integer**
> Number of entries requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

7	FUNCTION REQUIRES STATE AROP
220	SPECIFIED ARCHIVE FILE DOES NOT EXIST
538	START VALUE < ONE
539	REQUESTED NUMBER < ZERO
543	START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

totnum **— returned by the graPHIGS API, fullword integer**
Total number of structures in the specified archive file.

istrid **— returned by the graPHIGS API, fullword integer**
List of structure identifiers.

Chapter 18. Compatibility Subroutines

This chapter contains the subroutines that have been replaced by an extended version of the subroutine. The new extended subroutine performs the same function as was supported in prior releases, plus it does some additional function.

The subroutines found in this chapter will continue to be supported for compatibility; however, it is recommended that the new applications use the new extended version of the subroutine and that existing applications migrate over time to the new extended subroutines.

Under each subroutine in this chapter, there is a ″Related Subroutine″ section which contains the name of its new extended subroutine.

GPCR - Set Color Representation

GPCR (*wsid*, *index*, *number*, *colors*)

Purpose

Use **GPCR** to set the specified color values starting at the specified color table entry of the workstation's default color table. The color values are interpreted according to the workstation's current color model.

The workstation's default color table may be either its rendering color table or its display color table. If its display color table is modifiable, then it is the default, otherwise the rendering color table is modifiable, and thus, the default. (Use the Inquire Color Facilities [**GPQCF**] subroutine [page GPQCF - Inquire Color Facilities] to determine the characteristics of the workstation's color table).

If the color model is Hue-Saturation-Value (HSV), the first color component (hue) is specified as a fraction of the total range available (that is, zero to one is used to represent zero degrees to 360 degrees). If the second color component is zero, then the first color component is ignored.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

index — **specified by user, fullword integer**
Entry at which to begin setting the default color table (>=0).

number — **specified by user, fullword integer**
Number of entries to set (>=0).

colors — **specified by user, array of 3 short floating-point numbers**
The color table values to be set into the default color table (0<=component<=1).

The array is assumed to be in row order, such as `RED1`, `GREEN1`, `BLUE1`, `RED2`, `GREEN2`, `BLUE2`, etc... .

Error Codes

25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
49	COLOR INDEX EXCEEDS WORKSTATION TABLE CAPACITY
92	COLOR INDEX < ZERO

96	COLOR PARAMETER OUT OF RANGE FOR CURRENT COLOR MODEL
517	NUMBER OF INDEXES < ONE

GPEPLB - Set Element Pointer at Label

GPEPLB (*label*)

Purpose

Use **GPEPLB** to set the element pointer to the specified label element within the open structure.

Starting at the position following the element pointer, the graPHIGS API searches for the first occurrence of the specified *label*. If the end of the structure is reached, the system continues the search at element 1. If the specified *label* is not found, an error is generated.

> **Note:** This subroutine is not processed by the nucleus right away. It is processed by the nucleus when the next subroutine call is issued that forces requests to be sent to the nucleus. See "Controlling the System" section in the *The graPHIGS Programming Interface: Understanding Concepts* for a discussion on when requests are sent to the nucleus for processing.

Parameters

label **— specified by user, fullword integer**
     Label identifier.

Error Codes

4   FUNCTION REQUIRES STATE STOP

130   LABEL IDENTIFIER CANNOT BE FOUND IN THE OPEN STRUCTURE

Related Subroutines

GPEPPK - Set Element Pointer at Pick Identifier

GPEPPK (*pickid*)

Purpose

Use **GPEPPK** to set the element pointer to the specified Set Pick Identifier structure element within the open structure.

Starting with the position following the element pointer, the graPHIGS API searches for the first occurrence of the specified *pickid*. If the end of the structure is reached, the system continues the search at element 1. If the specified *pickid* is not found, an error is generated.

> **Note:** This subroutine is not processed by the nucleus right away. It is processed by the nucleus when the next subroutine call is issued that forces requests to be sent to the nucleus. See *The graPHIGS Programming Interface: Understanding Concepts* for a discussion on when requests are sent to the nucleus for processing.

Parameters

pickid — **specified by user, fullword integer**
Pick identifier.

Error Codes

GPER - Set Edge Representation

GPER (*wsid*, *index*, *edgefg*, *edgelt*, *edgesf*, *ecol*)

Purpose

Use **GPER** to set the given attribute values in the specified entry of the specified workstation.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

index — **specified by user, fullword integer**
Edge bundle table index (>=1).

edgefg — **specified by user, fullword integer**
Edge flag (1=OFF, 2=ON, 3=GEOMETRY_ONLY).

edgelt — **specified by user, fullword integer**

> Edge line type table index. Specifies an index into the workstation's edge line type table. The table size and specific entries supported are workstation dependent. Use the Inquire Edge Facilities (**GPQEF**) subroutine to locate the supported line types on your workstation. The default edge line type table for supported entries is defined with the following line types: (`1=SOLID_LINE`, `2=DASHED`, `3=DOTTED`, `4=DASH_DOT`, `5=LONG_DASH`, `6=DOUBLE_DOT`, `7=DASH_DOUBLE_DOT`, `8-n=SOLID_LINE`. Any entry may be changed by the Set Linetype Representation (**GPLTR**) subroutine except entry 1).

edgesf — **specified by user, short floating-point number.**

> Edge scale factor, specified as a fraction of the nominal width of a line. A line width scale factor of 1.0, which is the default, generates a nominal size line on any workstation. Any other value is mapped to the closest available line width on the workstation.

ecol — **specified by user, fullword integer**

> Edge color index (>=0).

Error Codes

25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
43	BUNDLE INDEX EXCEEDS WORKSTATION TABLE CAPACITY
60	BUNDLE INDEX VALUE < ONE
63	LINETYPE VALUE < ONE

93	COLOR INDEX VALUE(S) EXCEED WORKSTATION TABLE CAPACITY
311	EDGE FLAG VALUE IS INVALID

Related Subroutines

GPXER

> Set Extended Edge Representation

RCP code

201329412 (X'0C000B04')

GPIR - Set Interior Representation

GPIR (*wsid, index, style, sindex, icol*)

Purpose

Use **GPIR** to set the given attribute values in the specified table entry of the specified workstation.

The empty and hollow interior styles display nothing for the interior. If the edge flag is `1=OFF` and the style is `5=EMPTY`, then no visual output is generated. The interior is detectable when a primitive with empty interior style is encountered and it is eligible for picking as determined by it visibility and detectability.

If the edge flag is `1=OFF` and the style is `1=HOLLOW`, then the boundary is drawn. When a primitive with hollow interior style is encountered only the boundary of the primitive is eligible for picking as determined by its visibility and detectability.

Parameters

wsid **— specified by user, fullword integer**
> Workstation identifier.

index **— specified by user, fullword integer**
> Interior bundle table index (>=1). Index of bundle table entry to be loaded.

style **— specified by user, fullword integer**
> Interior style (1=HOLLOW, 2=SOLID, 3=PATTERN, 4=HATCH, 5=EMPTY).

sindex **— specified by user, fullword integer**
> Interior style index (>=1). This index points into either the pattern or the hatch table, depending on the interior style of the polygon.

icol **— specified by user, fullword integer**
> Interior color index (>=0). For interiors of style solid or hatch, the specified color is used to draw the interior. For interior style hollow, with the edge set to 1=OFF, the specified color is used to draw the perimeter of the polygon.

Error Codes

25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
43	BUNDLE INDEX EXCEEDS WORKSTATION TABLE CAPACITY
60	BUNDLE INDEX VALUE < ONE
83	INTERIOR STYLE NOT AVAILABLE ON WORKSTATION
84	INTERIOR STYLE INDEX VALUE < ONE

GPPLR - Set Polyline Representation

GPPLR (*wsid*, *index*, *ltype*, *lwidth*, *color*)

Purpose

Use **GPPLR** to set the given attribute values in the specified entry of the polyline bundle table.

Parameters

wsid **— specified by user, fullword integer**
> Workstation identifier.

index — **specified by user, fullword integer**
> Polyline bundle table index (>=1) Index of polyline bundle table entry to be loaded.

ltype — **specified by user, fullword integer**
> Specifies an index into the workstation's line type table. The table size and specific entries supported are workstation dependent. Use the Inquire Polyline Facilities (**GPQPLF**) subroutine to locate the supported line types on your workstation. The default line type table for supported entries is defined with the following line types: (1=SOLID_LINE, 2=DASHED, 3=DOTTED, 4=DASH_DOT, 5=LONG_DASH, 6=DOUBLE_DOT, 7=DASH_DOUBLE_DOT, 8-n=SOLID_LINE. Any entry may be changed by the Set Linetype Representation (**GPLTR**) subroutine except entry 1).

lwidth — **specified by user, short floating-point number**
> Line width scale factor is specified as a fraction of the nominal width of a line. A line width scale factor of 1.0, which is the default, generates a nominal size line on any workstation. Any other value is mapped to the closest line width available on the workstation.

color — **specified by user, fullword integer**
> Polyline color index (>=0)

Error Codes

25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
43	BUNDLE INDEX EXCEEDS WORKSTATION TABLE CAPACITY
60	BUNDLE INDEX VALUE < ONE
63	LINETYPE VALUE < ONE

GPPMR - Set Polymarker Representation

GPPMR (*wsid*, *index*, *mtype*, *msize*, *color*)

Purpose

Use **GPPMR** to set the given attribute values in the specified entry of the polymarker bundle table.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

index — **specified by user, fullword integer**
> Polymarker bundle table index (>=1). Index of table entry to be loaded.

mtype — **specified by user, fullword integer**
> Specifies an index into the marker type table of the workstation. The table size and specific entries supported are workstation dependent. Use the Inquire Polymarker Facilities (**GPQPMF**) subroutine to locate the supported marker types on your workstation. The default marker type table for supported entries is defined with the following marker types: (1=DOT, 2=PLUS_SIGN, 3=ASTERISK, 4=CIRCLE, 5=DIAGONAL_CROSS, 6-n=ASTERISK. Any entry may be changed by the Set Marker Type Representation (**GPMTR**) subroutine except entry 3).

msize — **specified by user, short floating-point number**
> Marker size scale factor is specified as a fraction of the nominal marker size. A marker size scale factor of 1.0, which is the default, generates a nominal size marker on any workstation. Any other value is mapped to the closest available marker size on the workstation.

color — **specified by user, fullword integer**
> Polymarker color index (>=0).

GPQABK - Inquire Actual Break Capabilities

GPQABK (*wsid, start, number, errind, ntrigs, ltrigs*)

Purpose

Use **GPQABK** to inquire the break action capabilities of the given workstation. A list of available triggers for a break action is returned.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
>   Workstation identifier.

start — **specified by user, fullword integer**
>   Starting member of the list of available triggers (>=1).

number — **specified by user, fullword integer**
>   Number of triggers requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
>   Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:
>
> | | |
> |---|---|
> | **25** | SPECIFIED WORKSTATION DOES NOT EXIST |
> | **38** | WORKSTATION HAS ONLY OUTPUT CAPABILITIES |
> | **538** | START VALUE < ONE |
> | **539** | REQUESTED NUMBER < ZERO |
> | **543** | START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED |
> | **572** | WORKSTATION DOES NOT SUPPORT PROGRAMMABLE BREAK ACTION |

ntrigs — **returned by the graPHIGS API, fullword integer**
>   Total number of entries in the list of available triggers.

ltrigs — **returned by the graPHIGS API, array of fullword integers**
>   List of available triggers as specified by the start and number parameters. The list is an array of trigger descriptors, consisting of three fullword integers each, in which a descriptor consists of a triplet containing the trigger type, low trigger qualifier, and high trigger qualifier. Positive integers as trigger types are choice device numbers. The trigger qualifier for a choice device is the choice number. The parameter *ntrigs* identifies the total number of triplets in the available trigger list. The actual number returned depends on the setting of the *start* and *number* parameters.

GPQACF - Inquire Actual Color Facilities

GPQACF (*wsid*, *errind*, *model*, *ncolor*, *avcolor*)

Purpose

Use **GPQACF** to inquire the actual color capabilities of the specified workstation.

The graPHIGS API returns the default color model, the maximum number of colors available, and data indicating if color is supported on the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid **— specified by user, fullword integer**
> Workstation identifier.

errind **— returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> | **3** | FUNCTION REQUIRES STATE WSOP |
> | **25** | SPECIFIED WORKSTATION DOES NOT EXIST |
> | **35** | WORKSTATION HAS ONLY INPUT CAPABILITIES |

model **— returned by the graPHIGS API, fullword integer**
> Color model (`1=RGB, 2=HSV, 3=CMY`).

ncolor **— returned by the graPHIGS API, fullword integer**
> Number of colors available (the total color palette size).

avcolor **— returned by the graPHIGS API, fullword integer**
> Color availability (`1=MONOCHROME, 2=COLOR`).

GPQADS - Inquire Actual Maximum Display Surface Size

| GPQADS (*wsid, errind, units, csize, asize*) |

Purpose

Use **GPQADS** to inquire the actual display surface size.

The graPHIGS API returns the values in Device Coordinate (DC) units and address units (for example, raster units) for the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **25**   SPECIFIED WORKSTATION DOES NOT EXIST

> **35**   WORKSTATION HAS ONLY INPUT CAPABILITIES

units — **returned by the graPHIGS API, fullword integer**
> Device coordinate units (1=METERS, 2=OTHER).

csize — **returned by the graPHIGS API, 3 short floating-point numbers**
> Actual display surface size in device coordinate units.

asize — **returned by the graPHIGS API, 3 fullword integers**
> Actual display surface size in address units.

Error Codes

None

GPQAEF - Inquire Actual Edge Facilities

GPQAEF (*wsid*, *start*, *number*, *errind*, *ntype*, *eltype*, *nelwidth*, *elwidth*, *minelw*, *maxelw*)

Purpose

Use **GPQAEF** to inquire the actual edge facilities of the specified workstation.

The graPHIGS API returns values indicating the identifiers of the linetypes; the maximum quantity available; and the nominal, minimum, and maximum line width values. The line widths are returned in Device Coordinates (DC) for the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the

available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

start — **specified by user, fullword integer**
Starting member of the list of edge line types (>=1).

number — **specified by user, fullword integer**
Number of edge line types requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
538	START VALUE < ONE
539	REQUESTED NUMBER < ZERO
543	START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

ntype — **returned by the graPHIGS API, fullword integer**
Total number of available edge line types.

eltype — **returned by the graPHIGS API, array of fullword integers**
Specifies an index into the workstation's edge line type table. The table size and specific entries supported are workstation dependent. The default edge line type table for supported entries is defined with the following line types: (1=SOLID_LINE, 2=DASHED, 3=DOTTED, 4=DASH_DOT, 5=LONG_DASH, 6=DOUBLE_DOT, 7=DASH_DOUBLE_DOT, 8-n=SOLID_LINE. Any entry may be changed by the Set Linetype Representation (**GPLTR**) subroutine except entry 1.)

The output array must be large enough to contain the requested data.

nelwidth — **returned by the graPHIGS API, fullword integer**
Total number of available line widths of edges. (Zero means that the workstation supports a continuous range of line widths of edges).

elwidth — **returned by the graPHIGS API, short floating-point number (DC)**
Nominal line width of edge.

minelw — **returned by the graPHIGS API, short floating-point number (DC)**
Minimum line width of edge.

maxelw — **returned by the graPHIGS API, short floating-point number (DC)**
Maximum line width of edge.

GPQAES - Inquire List of Actual Available Escape Subroutines

GPQAES (*wsid*, *start*, *number*, *errind*, *nids*, *idlist*)

Purpose

Use **GPQAES** to inquire the list of escape subroutine identifiers supported by a given workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
　　　Workstation identifier.

start — **specified by user, fullword integer**
　　　Starting member in the list of escape identifiers (>=1).

number — **specified by user, fullword integer**
　　　Number of escape identifiers requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
　　　Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

　　　25　　　SPECIFIED WORKSTATION DOES NOT EXIST

　　　538　　　START VALUE < ONE

　　　539　　　REQUESTED NUMBER < ZERO

　　　543　　　START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

nids — **returned by the graPHIGS API, fullword integer**
　　　Total number of available escape identifiers.

idlist — **returned by the graPHIGS API, array of fullword integers**
　　　List of available escape identifiers:
- 1001 = Sound Alarm
- 1002 = Enable/Disable Link Switch Notification
- 1003 = GDF/CGM Plot Size
- 1004 = Initialize Pick Correlation State
- 1005 = Set Pick Selection Criteria

GPQAFC - Inquire Annotation Font Characteristics

GPQAFC (*wsid, csid, font, start, num, errind, prec, nomh, nahsf, lahsf, lnfac, lmnfac, lmxfac*)

Purpose

Use **GPQAFC** to inquire information concerning the annotation text capabilities for the specified character set and font on the specified workstation.

The information consists of the highest text precision supported by the specified workstation for the specified *csid/ font*, the number of supported annotation height scale factors, the nominal character height in Device Coordinates, a list indicating exact supported height scale factors and the number of character expansion factors, minimum expansion factor and maximum expansion factor, corresponding to each height scale factor.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Annotation text capabilities are defined in terms of the following character box description:

```
    <----- width ------>

--------------------- <------------------ top line
|                   |                    ^
|                   |                    |
|- - - - - - - - - -| <--- cap line      |
|                   |                    ^

  |              |              v
  -------------------- <------------------ bottom line
```
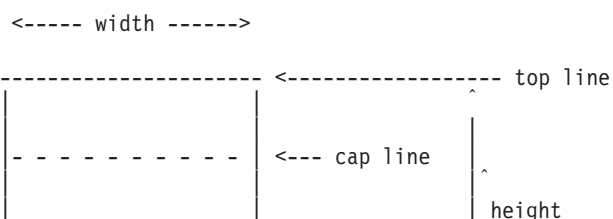

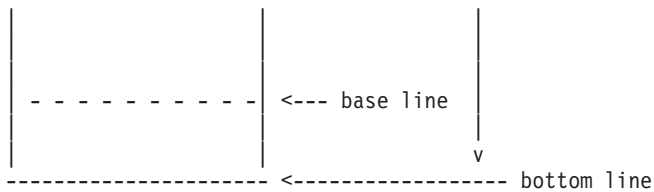

Height is defined as the distance between the top line and bottom line.

> **Note:** This subroutine exists to maintain compatibility with previous graPHIGS API releases. Values of returned data are calculated with a different definition of character height than is used by the Inquire Extended Annotation Font Characteristics (**GPQXAF**) subroutine, and by the Inquire Font Characteristics (**GPQFCH**) subroutine.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

csid — **specified by user, fullword integer**
> Character set identifier.
>
> See Appendix A. ″Character Set and Font Identifiers″ for more information.

font — **specified by user, fullword integer**
> Font identifier (>=1).

start — **specified by user, fullword integer**
> Starting member of the list of supported height scale factors (>=1).

num — **specified by user, fullword integer**
> Number of list elements requested (>=0) This number refers to the number of list elements that are returned.
>
> > **Note:** The four output arrays must be large enough to hold the requested number of elements.

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:
>
> | | |
> |---|---|
> | **25** | SPECIFIED WORKSTATION DOES NOT EXIST |
> | **35** | WORKSTATION HAS ONLY INPUT CAPABILITIES |
> | **75** | TEXT FONT VALUE IS INVALID |
> | **538** | START VALUE < ONE |
> | **539** | REQUESTED NUMBER < ZERO |
> | **542** | CHARACTER SET IDENTIFIER IS INVALID |
> | **543** | START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED |
> | **562** | CHARACTER SET/FONT COMBINATION IS NOT AVAILABLE FOR ANNOTATION |
> | **571** | INQUIRED INFORMATION IS NOT AVAILABLE |

prec — **returned by the graPHIGS API, fullword integer**
> Highest available precision for the corresponding *csid*/*font* (1=STRING_PREC, 2=CHAR_PREC, 3=STROKE_PREC). If the highest precision supported is stroke, then the following parameters refer to the workstation's capabilities for character precision with annotation text.

nomh — **returned by the graPHIGS API, short floating-point number (DC)**
> The bottom to top size, (top - bottom), in Device Coordinates (DC) for the nominal height font is returned in this field.

nahsf — **returned by the graPHIGS API, fullword integer**
> The total number of annotation sizes that are supported. This also defines the number of entries in each of the next four parameter lists except when this value is zero. Zero means that a continuous range of annotation sizes is supported and each of the lists contains two entries.

lahsf — **returned by the graPHIGS API, array of short floating-point numbers**
> List of the annotation height scale factors that are supported. The first entry is 1.0×10^{-30} and the second entry is 9.9×10^{30} if the device supports a continuous range of annotation heights.
>
> > **Note:** This list has one entry for each annotation size supported. Its length is determined by the *nahsf* field except when that contains 0. In this case, this list has two entries. The first entry contains information for the minimum annotation height scale factor. The second contains information for the maximum.

lnfac — **returned by the graPHIGS API, array of fullword integers**
> List of numbers of expansion factors that are supported. There is one entry for each of the supported annotation height scale factors. Zero means that a continuous range of expansion factors is supported for the font size.
>
> > **Note:** The length of this list is determined by the *nahsf* field except when that contains 0. In this case, there are two entries in this list. The first entry contains information for the minimum annotation height scale factor. The second contains information for the maximum.

lmnfac — **returned by the graPHIGS API, array of short floating-point numbers**
> List of minimum expansion factors that are supported. There is one entry for each of the supported annotation height scale factors. For devices which support all possible expansion factors, there is one entry for each of the supported annotation height scale factors. For devices which support all possible expansion factors, this parameter is a very small positive number (e.g. 10^{-30}).
>
> > **Note:** The length of this list is determined by the *nahsf* field except when that contains 0. In this case, there are two entries in this list. The first entry contains information for the minimum annotation height scale factor. The second contains information for the maximum.
>
> > **Note:** The expansion factor is computed as follows: expf = (W/H) / generic where 'W' and 'H' are the width and height for the font with the corresponding scale factor and generic is the (W/H) ratio for a generic font and has the value 0.86667 (=65/75)

lmxfac — **returned by the graPHIGS API, array of short floating-point numbers**
> List of maximum expansion factors that are supported. There is one entry for each of the supported annotation height scale factors. For devices which support all possible expansion factors, this parameter should contain a very large positive number (e.g. 9.9×10^{30}).
>
> > **Note:** The length of this list is determined by the *nahsf* field except when that contains 0. In this case, there are two entries in this list. The first entry contains information for the minimum annotation height scale factor. The second contains information for the maximum.
>
> > **Note:** The expansion factor is computed as follows: expf = (W/H) / generic where 'W' and 'H' are the width and height for the font with the corresponding scale factor and generic is the (W/H) ratio for a generic font and has the value 0.86667 (=65/75).

GPQAFP - Inquire Actual Font Pool Size

GPQAFP (*wsid*, *errind*, *poolsize*)

Purpose

Use **GPQAFP** to inquire the actual font pool size for the specified workstation.

This represents the maximum number of fonts that can be simultaneously active on this workstation after it is open. The size is specified as the number of fonts.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES

poolsize — **returned by the graPHIGS API, fullword integer**
Font pool size for this workstation.

GPQAGD - Inquire List of Actual Generalized Drawing Primitives

GPQAGD (*wsid*, *start*, *number*, *errind*, *ngdp*, *lgdp*)

Purpose

Use **GPQAGD** to inquire the actual generalized drawing primitives (GDP) available on the specified workstation.

The graPHIGS API returns the number of primitives available, and their GDP identifiers.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

start — **specified by user, fullword integer**
> Starting member of the list of GDP identifiers (>=1).

number — **specified by user, fullword integer**
> Number of GDP identifiers requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

GPQAIF - Inquire Actual Interior Facilities

GPQAIF (*wsid*, *startp*, *nump*, *starth*, *numh*, *errind*, *intnum*, *interiors*, *hatnum*, *hatch*)

Purpose

Use **GPQAIF** to inquire the actual interior facilities of a particular workstation. The graPHIGS API returns values indicating the maximum quantity of interior styles and their identifiers and the maximum quantity of hatch styles and their identifiers at the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

startp — **specified by user, fullword integer**
Starting member of the list of interior styles (>=1).

nump — **specified by user, fullword integer**
Number of interior styles requested (>=0).

starth — **specified by user, fullword integer**
Starting member of the list of hatch styles (>=1).

numh — **specified by user, fullword integer**
Number of hatch styles requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

25	SPECIFIED WORKSTATION DOES NOT EXIST
35	WORKSTATION HAS ONLY INPUT CAPABILITIES
538	START VALUE < ONE
539	REQUESTED NUMBER < ZERO
543	START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

intnum — **returned by the graPHIGS API, fullword integer**
Total number of available interior styles.

interiors — **returned by the graPHIGS API, array of fullword integers**
List of available interior styles (1=HOLLOW, 2=SOLID, 3=PATTERN, 4=HATCH, 5=EMPTY) The output array must be large enough to contain the requested data.

hatnum — **returned by the graPHIGS API, fullword integer**
Total number of available hatch styles.

hatch — **returned by the graPHIGS API, array of fullword integers.**
List of available hatch styles. The output array must be large enough to contain the requested data.

See GPISI - Set Interior Style Index for the default hatch styles in the workstation's hatch table.

GPQAIS - Inquire Actual Input Character Set Facilities

GPQAIS (*wsid*, *class*, *device*, *start*, *number*, *errind*, *ncsid*, *csid*)

Purpose

Use **GPQAIS** to inquire the actual input character sets that are available for a specified input device.

The values returned by the graPHIGS API indicate the total quantity of character sets available and their identifiers.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

class — **specified by user, fullword integer**
> Device class requested (1=LOCATOR, 2=STROKE, 3=VALUATOR, 4=CHOICE, 5=PICK, 6=STRING).

device — **specified by user, fullword integer**
> Device number.

start — **specified by user, fullword integer**
> Starting member of the list of character set identifiers (>=1).

number — **specified by user, fullword integer**
> Number of character set identifiers requested (>=0). Number refers to the number of *csid* values the graPHIGS API returns.

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> | | |
> |---|---|
> | **25** | SPECIFIED WORKSTATION DOES NOT EXIST |
> | **38** | WORKSTATION HAS ONLY OUTPUT CAPABILITIES |
> | **140** | DEVICE NUMBER < ONE OR DEVICE NOT AVAILABLE |

GPQAIT - Inquire Actual Input Trigger Capabilities

GPQAIT (*wsid*, *class*, *devnum*, *start*, *number*, *errind*, *ntrigs*, *ltrigs*)

Purpose

Use **GPQAIT** to inquire the input device trigger capabilities of a specified device on a given workstation. If the triggers are programmable, a list of available triggers is returned. The returned list corresponds to the available triggers for all triggers of the given input device.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

class — **specified by user, fullword integer**
Input device class (1=LOCATOR, 2=STROKE, 3=VALUATOR, 4=CHOICE, 5=PICK, 6=STRING).

devnum — **specified by user, fullword integer**
Input device number (>=1).

start — **specified by user, fullword integer**
Starting member in the list of available trigger types (>=1).

number — **specified by user, fullword integer**
Number of triggers requested from the list (>=0).

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

25	SPECIFIED WORKSTATION DOES NOT EXIST
38	WORKSTATION HAS ONLY OUTPUT CAPABILITIES
140	DEVICE NUMBER < ONE OR DEVICE NOT AVAILABLE
328	INPUT CLASS VALUE IS INVALID

538 START VALUE < ONE

539 REQUESTED NUMBER < ZERO

543 START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

569 DEVICE DOES NOT SUPPORT PROGRAMMABLE TRIGGERS

ntrigs **— returned by the graPHIGS API, fullword integer**
Total number of entries in the list of available triggers.

ltrigs **— returned by the graPHIGS API, array of fullword integers**
List of trigger descriptor triplets. The list is an array of trigger descriptors in which each descriptor consists of three fullword integers designating the trigger type, low trigger qualifier, and high trigger qualifier. The trigger type field has the following meanings:

Type **Meaning**

>0 Identifier of physical device within the button category.

The trigger qualifiers for this trigger type are a range of choice numbers generated by the physical device.

-1 Change of the measure of the logical input device

The trigger qualifier fields are ignored.

The parameter *ntrigs* identifies the total number of triplets in the available trigger list. The actual number returned depends on the setting of the *start* and *number* parameters.

GPQALF - Inquire Actual Polyline Facilities

GPQALF (*wsid, start, number, errind, ntype, ltype, nlwidth, lwidth, minlw, maxlw*)

Purpose

Use **GPQALF** to inquire the actual polyline facilities for the specific workstation.

The values returned by the graPHIGS API indicate the total quantity of available linetypes, the specific supported linetypes, and the total quantity of available line widths and their minimum and maximum values. The returned widths of the line are in Device Coordinates for the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
    Workstation identifier.

start — **specified by user, fullword integer**
    Starting member of the list of linetypes (>=1).

number — **specified by user, fullword integer**
    Number of linetypes requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
    If the error indicator is zero, the request was completed. Otherwise, one of the following errors exists:

      25   SPECIFIED WORKSTATION DOES NOT EXIST

      35   WORKSTATION HAS ONLY INPUT CAPABILITIES

      538   START VALUE < ONE

      539   REQUESTED NUMBER < ZERO

      543   START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

ntype — **returned by the graPHIGS API, fullword integer**
    Total number of available linetypes.

ltype — **returned by the graPHIGS API, array of fullword integers.**
    Specifies an index into the workstation's available line type table. The table size and specific entries are workstation dependent. The default available line type table for supported entries is defined with the following line types: (`1=SOLID_LINE`, `2=DASHED`, `3=DOTTED`, `4=DASH_DOT`, `5=LONG_DASH`, `6=DOUBLE_DOT`, `7=DASH_DOUBLE_DOT`, `8-n=SOLID_LINE`. Any entry may be changed by the Set Linetype Representation (**GPLTR**) subroutine except entry 1).

    The output array must be large enough to contain the requested data.

nlwidth — **returned by the graPHIGS API, fullword integer**
    Number of available line widths. (Zero means that the workstation supports a continuous range of line widths.)

lwidth — **returned by the graPHIGS API, short floating-point number (DC)**
    Nominal line width.

minlw — **returned by the graPHIGS API, short floating-point number (DC)**
    Minimum line width.

maxlw — **returned by the graPHIGS API, short floating-point number (DC)**
    Maximum line width.

GPQALI - Inquire List of Actual Logical Input Devices

GPQALI (*wsid*, *class*, *start*, *number*, *errind*, *ndev*, *dev*)

Purpose

Use **GPQALI** to inquire the available input devices at the specified workstation.

For the specified device class, the graPHIGS API returns a number indicating the quantity of logical devices and their numbers for the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
>Workstation identifier.

class — **specified by user, fullword integer**
>Device class (1=LOCATOR, 2=STROKE, 3=VALUATOR, 4=CHOICE, 5=PICK, 6=STRING).

start — **specified by user, fullword integer**
>Starting member of the list of input devices (>=1).

number — **specified by user, fullword integer**
>Number of input device numbers requested (>=0) This refers to the total quantity of device numbers the graPHIGS API returns.

errind — **returned by the graPHIGS API, fullword integer**
>Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

>| | |
>| --- | --- |
>| **25** | SPECIFIED WORKSTATION DOES NOT EXIST |

GPQALW - Inquire Actual Length of Workstation State Tables

GPQALW (*wsid*, *errind*, *ltable*, *mtable*, *ttable*, *itable*, *etable*, *pttable*, *ctable*)

Purpose

Use **GPQALW** to inquire the actual length of the workstation tables in the WSL.

The graPHIGS API returns values indicating the maximum number of entries in the bundle and color tables for the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

25 SPECIFIED WORKSTATION DOES NOT EXIST

35 WORKSTATION HAS ONLY INPUT CAPABILITIES

ltable — **returned by the graPHIGS API, fullword integer**
Total number of polyline bundle table entries.

mtable — **returned by the graPHIGS API, fullword integer**
Total number of polymarker bundle table entries.

ttable — **returned by the graPHIGS API, fullword integer**
Total number of text bundle table entries.

itable **— returned by the graPHIGS API, fullword integer**
> Total number of interior bundle table entries.

etable **— returned by the graPHIGS API, fullword integer**
> Total number of edge bundle table entries.

GPQAMF - Inquire Actual Polymarker Facilities

GPQAMF (*wsid*, *start*, *number*, *errind*, *ntype*, *mtype*, *nsize*, *size*, *minms*, *maxms*)

Purpose

Use **GPQAMF** to inquire the quantity of polymarker types and polymarker sizes on the specified workstation.

The graPHIGS API returns a number that indicates the total quantity of polymarker types and their identifiers and data indicating the total quantity of nominal, minimum, and maximum polymarker sizes for the specified workstation. The marker sizes are returned in Device Coordinates (DC) If the number of available marker sizes is returned as zero, the workstation supports a continuous range of marker sizes within the minimum and maximum sizes indicated.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid **— specified by user, fullword integer**
> Workstation identifier.

start **— specified by user, fullword integer**
> Starting member of the list of marker types (>=1).

number **— specified by user, fullword integer**
> Number of marker types requested (>=0).

This number refers to the quantity of marker type values the graPHIGS API returns.

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

25 SPECIFIED WORKSTATION DOES NOT EXIST

35 WORKSTATION HAS ONLY INPUT CAPABILITIES

538 START VALUE < ONE

539 REQUESTED NUMBER < ZERO

543 START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

ntype — **returned by the graPHIGS API, fullword integer**
Total number of available marker types.

mtype — **returned by the graPHIGS API, array of fullword integers.**
Specifies an index into the marker type table of the workstation. The table size and specific entries supported are workstation dependent. The default marker type table for supported entries is defined with the following marker types: (`1=DOT, 2=PLUS_SIGN, 3=ASTERISK, 4=CIRCLE, 5=DIAGONAL_CROSS, 6-n=ASTERISK`. Any entry may be changed by the Set Marker Type Representation (**GPMTR**) subroutine except entry 3. Any output array must be large enough to contain the requested data.

nsize — **returned by the graPHIGS API, fullword integer**
Number of available marker sizes. (Zero means that the workstation supports a continuous range of marker sizes).

size — **returned by the graPHIGS API, short floating-point number (DC)**
Nominal marker size.

minms — **returned by the graPHIGS API, short floating-point number (DC)**
Minimum marker size.

maxms — **returned by the graPHIGS API, short floating-point number (DC)**
Maximum marker size.

GPQANV - Inquire Actual Number of Definable View Table Entries

GPQANV (*wsid, errind, number*)

Purpose

Use **GPQANV** to inquire the quantity of definable view table entries for the specified workstation. (View zero is not included because it cannot be modified).

The number the graPHIGS API returns indicates the quantity of view table entries that can be defined for the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

25   SPECIFIED WORKSTATION DOES NOT EXIST

35   WORKSTATION HAS ONLY INPUT CAPABILITIES

number — **returned by the graPHIGS API, fullword integer**
Number of definable view table indexes. (Entry 0 may not be changed.)

Error Codes

GPQAPF - Inquire Actual Pattern Facilities

GPQAPF (*wsid, errind, maxrow, maxcol*)

Purpose

Use **GPQAPF** to inquire the maximum pattern dimensions supported by the specified workstation.

The values the graPHIGS API returns indicate the maximum quantity of rows and columns that can be placed in a pattern array for the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **25** SPECIFIED WORKSTATION DOES NOT EXIST

> **35** WORKSTATION HAS ONLY INPUT CAPABILITIES

maxrow — **returned by the graPHIGS API, fullword integer**
> Maximum number of rows in the pattern array.

maxcol — **returned by the graPHIGS API, fullword integer**
> Maximum number of columns in the pattern array.

GPQAPS - Inquire Actual Primary Character Set

GPQAPS (*wsid*, *errind*, *csid*)

Purpose

Use **GPQAPS** to inquire the primary character set on the specified workstation.

The graPHIGS API returns the primary Character Set Identifier (*csid*) for the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
>   Workstation identifier.

errind — **returned by the graPHIGS API, fullword integer**
>   Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:
>
> | | |
> |---|---|
> | **25** | SPECIFIED WORKSTATION DOES NOT EXIST |
> | **35** | WORKSTATION HAS ONLY INPUT CAPABILITIES |

csid — **returned by the graPHIGS API, fullword integer**
>   Character set identifier. See Appendix A. ″Character Set and Font Identifiers″ for more information.

GPQAVF - Inquire Actual View Facilities

GPQAVF (*wsid*, *errind*, *shield*)

Purpose

Use **GPQAVF** to inquire the availability of view shielding for the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
>   Workstation identifier.

errind — **returned by the graPHIGS API, fullword integer**
>   Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:
>
> | | |
> |---|---|
> | **25** | SPECIFIED WORKSTATION DOES NOT EXIST |
> | **35** | WORKSTATION HAS ONLY INPUT CAPABILITIES |

shield — **returned by the graPHIGS API, fullword integer**
>   Shielding available (`1=NOT_AVAILABLE`, `2=AVAILABLE`).

GPQAWC - Inquire Actual Workstation Category

GPQAWC (*wsid*, *errind*, *type*)

Purpose

Use **GPQAWC** to inquire the actual workstation category for the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
>   Workstation identifier.

errind — **returned by the graPHIGS API, fullword integer**
>   Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

>   **25**   SPECIFIED WORKSTATION DOES NOT EXIST

type — **returned by the graPHIGS API, fullword integer**
>   Workstation category (`1=OUTPUT`, `2=INPUT`, `3=OUTIN`).

GPQAWD - Inquire Actual Workstation Display Classification

GPQAWD (*wsid*, *errind*, *type*)

Purpose

Use **GPQAWD** to inquire the actual type of display technology for the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
  Workstation identifier.

errind — **returned by the graPHIGS API, fullword integer**
  Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

  25 SPECIFIED WORKSTATION DOES NOT EXIST

type — **returned by the graPHIGS API, fullword integer**
  Display type (1=VECTOR, 2=RASTER, 3=OTHERS).

GPQCR - Inquire Color Representation

GPQCR (*wsid*, *start*, *number*, *type*, *errind*, *colors*)

Purpose

Use **GPQCR** to inquire the current color values in the specified workstation's default color table.

If the workstation's display color table is modifiable, then the display color table is the workstation's default. Otherwise the rendering color table is the workstation's default color table.

Use Inquire Extended Color Facilities (**GPQXCF**) subroutine to inquire the characteristics of the workstation's color table.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Use Inquire Actual Length of Workstation Tables (**GPQALW**) subroutine to determine the actual size of the workstation's color table.

Parameters

wsid — **specified by user, fullword integer**
    Workstation identifier.

start — **specified by user, fullword integer**
    Index specifying an entry into the default color table to start returning the requested color values (>=0).

number — **specified by user, fullword integer**
    Number of color table entries requested (>=0).

type — **specified by user, fullword integer**
    Type of returned values (1=SET).

errind — **returned by the graPHIGS API, fullword integer**
    Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

    25   SPECIFIED WORKSTATION DOES NOT EXIST

    35   WORKSTATION HAS ONLY INPUT CAPABILITIES

    534   TYPE VALUE IS INVALID

    539   REQUESTED NUMBER < ZERO

    544   START VALUE < ZERO

    551   START VALUE EXCEEDS COLOR TABLE SIZE

colors — **returned by the graPHIGS API, array of three short floating-point numbers**
    Color components are to be interpreted by the current color model. The array contains a list of color table entries ordered by row. The output array must be large enough to contain the requested data.

Error Codes

None

GPQCVX - Inquire Current Viewing Transformation

> **GPQCVX (wsid, view, errind, matrix, window, viewpt, viewt, refpt, dist, near, far, wincp, nearcp, farcp, shield, shldci, border, brdrci, viewact)**

Purpose

Use **GPQCVX** to inquire the current view information for the specified view on the specified workstation.

If your application uses direct color to set the shielding or border color of the specified view, then you must use the Inquire Current View Representation (**GPQCVR**) subroutine to inquire the view information.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (errind) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

view — **specified by user, fullword integer**
> View index (>=0).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> **25**   SPECIFIED WORKSTATION DOES NOT EXIST

> **59**   VIEW INDEX VALUE < ZERO

> **323**   VIEW INDEX EXCEEDS VIEW TABLE CAPACITY

> **526**   REQUESTED DATA NOT AVAILABLE FOR THIS FUNCTION

matrix — **returned by the graPHIGS API, 16 short floating-point numbers**
> Current viewing transformation matrix. For the transformation matrix, the elements are returned in the following order:

```
|m11 m12 m13 m14|
|m21 m22 m23 m24|---> (m11,m12,m13,m14,m21...m44)
|m31 m32 m33 m34|
|m41 m42 m43 m44|
```

window — **returned by the graPHIGS API, 4 short floating-point numbers (VC)**
> Current window (Umin, Umax, Vmin, Vmax).

viewpt — **returned by the graPHIGS API, 6 short floating-point numbers (NPC)**
> Current viewport (Xmin, Xmax, Ymin, Ymax, Zmin, Zmax)

viewt — **returned by the graPHIGS API, fullword integer**
> Current view type (1=PARALLEL, 2=PERSPECTIVE)

refpt — **returned by the graPHIGS API, 3 short floating-point numbers (VC)**
    Current projection reference point (*u*, *v*, *n*)

dist — **returned by the graPHIGS API, short floating-point number (VC)**
    Current distance of view plane from the view reference point along the n-axis.

near — **returned by the graPHIGS API, short floating-point number (VC)**
    Current distance of near clipping plane from the view reference point along the n-axis.

far — **returned by the graPHIGS API, short floating-point number (VC)**
    Current distance of far clipping plane from the view reference point along the n-axis.

wincp — **returned by the graPHIGS API, fullword integer**
    Current window clipping indicator (1=NOCLIP, 2=CLIP)

nearcp — **returned by the graPHIGS API, fullword integer**
    Current near clipping indicator (1=NOCLIP, 2=CLIP).

farcp — **returned by the graPHIGS API, fullword integer**
    Current far clipping indicator (1=NOCLIP, 2=CLIP).

shield — **returned by the graPHIGS API, fullword integer**
    Current shielding indicator (1=OFF, 2=ON).

shldci — **returned by the graPHIGS API, fullword integer**
    Current shielding color index.

    Note: Direct shielding color returns error indicator 526.

border — **returned by the graPHIGS API, fullword integer**
    Current view border indicator (1=OFF, 2=ON).

brdrci — **returned by the graPHIGS API, fullword integer**
    Current view border color index.

    Note: Direct border color returns error indicator 526.

viewact — **returned by the graPHIGS API, fullword integer**
    Current view active indicator for output (1=INACTIVE, 2=ACTIVE).

GPQE - Inquire Element Content

GPQE (*start*, *number*, *errind*, *ndata*, *data*)

Purpose

Use **GPQE** to retrieve the current structure element content that is indicated by the element pointer. It will only return the data if the element is an element supported by Version 1 of the graPHIGS API.

This subroutine returns the data contained in the current element. The number of bytes in the element and the element contents are returned. The element type can be determined by using the Inquire List of Element Headers (**GPQEHD**) subroutine (or, to maintain compatibility with previous releases, the Inquire Element Type and Size [**GPQETS**] [page GPQETS - Inquire Element Type and Size] subroutine).

To execute this subroutine, a structure must be open.

For information on the format of the data, see *The graPHIGS Programming Interface: Technical Reference*.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

> **Note:** This subroutine exists to maintain compatibility with previous graPHIGS API releases. The format of the data returned is different from that returned with the Inquire List of Element Data (**GPQED**) subroutine. This subroutine can not return the element content for all the new structure elements that were not supported in graPHIGS API Version 1. For the new structure elements, the Inquire List of Element Data (**GPQED**) subroutine must be used to get the element content.

Parameters

start — **specified by user, fullword integer**
> Starting byte offset in the element content (>=1).

number — **specified by user, fullword integer**
> Number of bytes of the element content requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> | | |
> |---|---|
> | **4** | FUNCTION REQUIRES STATE STOP |
> | **526** | REQUESTED DATA NOT AVAILABLE FOR THIS FUNCTION |
> | **535** | CURRENT ELEMENT POINTER IS ZERO |
> | **538** | START VALUE < ONE |
> | **539** | REQUESTED NUMBER < ZERO |
> | **543** | START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED |

ndata — **returned by the graPHIGS API, fullword integer**
> Total number of bytes in the element record.

data — **returned by the graPHIGS API, variable length data**
> Structure element content. The output array must be large enough to contain the requested data.

GPQER - Inquire Edge Representation

GPQER (*wsid*, *index*, *type*, *errind*, *edgefg*, *edgelt*, *edgesf*, *ecol*)

Purpose

Use **GPQER** to inquire the current attribute values in the specified entry in the edge bundle table of the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
    Workstation identifier.

index — **specified by user, fullword integer**
    Edge bundle table index (>=1).

type — **specified by user, fullword integer**
    Type of returned values (1=SET).

errind — **returned by the graPHIGS API, fullword integer**
    Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

    25   SPECIFIED WORKSTATION DOES NOT EXIST

    35   WORKSTATION HAS ONLY INPUT CAPABILITIES

    43   BUNDLE INDEX EXCEEDS WORKSTATION TABLE CAPACITY

    60   BUNDLE INDEX VALUE < ONE

    526   REQUESTED DATA NOT AVAILABLE FOR THIS FUNCTION

    534   TYPE VALUE IS INVALID

edgefg — **returned by the graPHIGS API, fullword integer**
    Edge flag in the specified edge table entry (1=OFF, 2=ON, 3=GEOMETRY_ONLY).

edgelt — **returned by the graPHIGS API, fullword integer**
    Specifies an index into the workstation's edge line type table. The table size and specified entries supported are workstation dependent. The default edge line type table for supported entries is defined with the following line types: 1=SOLID_LINE, 2=DASHED, 3=DOTTED, 4=DASH_DOT, 5=LONG_DASH, 6=DOUBLE_DOT, 7=DASH_DOUBLE_DOT, 8-n=SOLID_LINE. Any entry may be changed by the Set Linetype Representation (**GPLTR**) subroutine except entry 1.

edgesf — **returned by the graPHIGS API, short floating-point number**
>   Edge scale factor in the specified edge table entry.

ecol — **returned by the graPHIGS API, fullword integer**
>   Edge color index in the specified edge table entry.

>   **Note:** Direct edge color returns error indicator 526.

GPQETS - Inquire Element Type and Size

GPQETS (*errind*, *type*, *size*)

Purpose

Use **GPQETS** to inquire the type and size of the current element. It will only return the data if the current element is an element supported by Version 1 of the graPHIGS API.

The subroutine returns the element type and size in bytes. To use this subroutine a structure must be open. If the element pointer is currently zero, a value of zero is returned in the *type* parameter. To retrieve the element contents, use the Inquire List of Element Data (**GPQED**) subroutine or, to maintain compatibility with previous releases, use Inquire Element Content (**GPQE**) subroutine.

>   **Note:** This subroutine exists to maintain compatibility with previous graPHIGS API releases. The format of the data returned is different from that returned with **GPQED**. This subroutine can not return the element header information (type and size) for all the new structure elements that were not supported in graPHIGS API Version 1. For the new structure elements, use the Inquire List of Element Headers (**GPQEHD**) subroutine which must be used to get the element header information.

Parameters

errind — **returned by the graPHIGS API, fullword integer**
>   Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

>   **4**   FUNCTION REQUIRES STATE STOP

>   **526**   REQUESTED DATA NOT AVAILABLE FOR THIS FUNCTION

type — **returned by the graPHIGS API, fullword integer**
>   Element type.

>   A value of zero indicates that the current element pointer is zero. Otherwise, current element types are as follows:

GPQIR - Inquire Interior Representation

GPQIR (*wsid, index, type, errind, style, sindex, icol*)

Purpose

Use **GPQIR** to inquire the current attribute values in the specified entry in the interior bundle table for the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
>   Workstation identifier.

index — **specified by user, fullword integer**
>   Interior bundle table index (>=1).

type — **specified by user, fullword integer**
>   Type of returned values (`1=SET`).

errind — **returned by the graPHIGS API, fullword integer**
>   Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

GPQMR - Inquire Polymarker Representation

GPQMR (*wsid*, *index*, *type*, *errind*, *mtype*, *msize*, *color*)

Purpose

Use **GPQMR** to inquire the current attribute values in the specified entry in the polymarker bundle table of the specified workstation.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

index — **specified by user, fullword integer**
> Polymarker bundle table index (>=1).

type — **specified by user, fullword integer**
> Type of returned values (`1=SET`).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> | | |
> | --- | --- |
> | **25** | SPECIFIED WORKSTATION DOES NOT EXIST |
> | **35** | WORKSTATION HAS ONLY INPUT CAPABILITIES |
> | **43** | BUNDLE INDEX EXCEEDS WORKSTATION TABLE CAPACITY |
> | **60** | BUNDLE INDEX VALUE < ONE |
> | **526** | REQUESTED DATA NOT AVAILABLE FOR THIS FUNCTION |
> | **534** | TYPE VALUE IS INVALID |

mtype — **returned by the graPHIGS API, fullword integer**
> Marker type in the specified entry.

msize — **returned by the graPHIGS API, short floating-point number**
> Marker size scale factor in the specified entry.

color — **returned by the graPHIGS API, fullword integer**
> Polymarker color index in the specified entry.

> > **Note:** Direct polymarker color returns error indicator 526.

GPQRVX - Inquire Requested Viewing Transformation

> **GPQRVX (***wsid***,** ***view***,** ***errind***,** ***matrix***,** ***window***,** ***viewpt***,** ***viewt***,** ***refpt***,** ***dist***,** ***near***,** ***far***,** ***wincp***,** ***nearcp***,** ***farcp***,** ***shield***,**
> ***shldci***,** ***border***,** ***brdrci***,** ***viewact***)**

Purpose

Use **GPQRVX** to inquire the viewing parameters of a specified view in the specified workstation view table. These values are not current, if the values have been passed to the graPHIGS API but the workstation has not been updated. If your application uses direct color to set the shielding or border color of the specified view, then you must use the Inquire Requested View Representation (**GPQRVR**) subroutine to inquire the view information.

The graPHIGS API returns the requested viewing transformation matrix, the requested viewport, and the view characteristics.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

view — **specified by user, fullword integer**
> View index (>=0).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> | | |
> |---|---|
> | **25** | SPECIFIED WORKSTATION DOES NOT EXIST |
> | **59** | VIEW INDEX VALUE < ZERO |
> | **323** | VIEW INDEX EXCEEDS VIEW TABLE CAPACITY |
> | **526** | REQUESTED DATA NOT AVAILABLE FOR THIS FUNCTION |

matrix — **returned by the graPHIGS API, 16 short floating-point numbers**
> Requested viewing transformation matrix. For the transformation matrix, the elements are returned in the following order:

```
|m11 m12 m13 m14|
|m21 m22 m23 m24|---> (m11,m12,m13,m14,m21...m44)
|m31 m32 m33 m34|
|m41 m42 m43 m44|
```

window — **returned by the graPHIGS API, 4 short floating-point numbers (VC)**
>   Requested window (Umin, Umax, Vmin, Vmax).

viewpt — **returned by the graPHIGS API, 6 short floating-point numbers (NPC)**
>   Requested viewport (Xmin, Xmax, Ymin, Ymax, Zmin, Zmax).

viewt — **returned by the graPHIGS API, fullword integer**
>   Requested view type (`1=PARALLEL`, `2=PERSPECTIVE`).

refpt — **returned by the graPHIGS API, 3 short floating-point numbers (VC)**
>   Requested projection reference point (*u, v, n*).

dist — **returned by the graPHIGS API, short floating-point number (VC)**
>   Requested distance of the view plane from the view reference point along the n-axis.

near — **returned by the graPHIGS API, short floating-point number (VC)**
>   Requested distance of the near clipping plane from the view reference point along the n-axis.

far — **returned by the graPHIGS API, short floating-point number (VC)**
>   Requested distance of the far clipping plane from the view reference point along the n-axis.

wincp — **returned by the graPHIGS API, fullword integer**
>   Requested window clipping indicator (`1=NOCLIP`, `2=CLIP`).

nearcp — **returned by the graPHIGS API, fullword integer**
>   Requested near clipping indicator (`1=NOCLIP`, `2=CLIP`).

farcp — **returned by the graPHIGS API, fullword integer**
>   Requested far clipping indicator (`1=NOCLIP`, `2=CLIP`).

shield — **returned by the graPHIGS API, fullword integer**
>   Requested shielding indicator (`1=OFF`, `2=ON`).

shldci — **returned by the graPHIGS API, fullword integer**
>   Requested shielding color index.

>   **Note:** Direct shielding color returns error indicator 526.

border — **returned by the graPHIGS API, fullword integer**
>   Requested view border indicator (`1=OFF`, `2=ON`).

brdrci — **returned by the graPHIGS API, fullword integer**
>   Requested view border color index.

>   **Note:** Direct border color returns error indicator 526.

viewact — **returned by the graPHIGS API, fullword integer**
>   Requested view active indicator for output (`1=INACTIVE`, `2=ACTIVE`).

GPQSTE - Inquire Structure Existence

GPQSTE (*strid*, *flag*)

Purpose

Use **GPQSTE** to inquire whether the specified structure exists in the currently selected structure store.

If there is no structure store currently selected, that is, the current structure state is Structure Store Close (SSCL) or Structure Store Open (SSOP), the structure existence indicator returns `1=NON_EXISTENT`.

Parameters

strid — **specified by user, fullword integer**
Structure identifier.

flag — **returned by the graPHIGS API, fullword integer**
Structure existence indicator (`1=NON_EXISTENT, 2=EXISTENT`).

GPQTR - Inquire Text Representation

GPQTR (*wsid*, *index*, *type*, *errind*, *font*, *prec*, *factor*, *space*, *color*)

Purpose

Use **GPQTR** to inquire the current text attributes contained in the specified entry in the text bundle table of the specified workstation.

The graPHIGS API returns data indicating the text font and precision, character expansion factor and spacing, and text color of the specified entry.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
Workstation identifier.

index — **specified by user, fullword integer**
> Text bundle table index (>=1).

type — **specified by user, fullword integer**
> Type of returned values (`1=SET`).

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> | | |
> |---|---|
> | **25** | SPECIFIED WORKSTATION DOES NOT EXIST |
> | **35** | WORKSTATION HAS ONLY INPUT CAPABILITIES |

> | **526** | REQUESTED DATA NOT AVAILABLE FOR THIS FUNCTION |
> | **534** | TYPE VALUE IS INVALID |

font — **returned by the graPHIGS API, fullword integer**
> Text font corresponding to the specified entry.

prec — **returned by the graPHIGS API, fullword integer**
> Text precision corresponding to the specified entry (`1=STRING_PREC, 2=CHAR_PREC, 3=STROKE_PREC`).

factor — **returned by the graPHIGS API, short floating-point number**
> Character expansion factor corresponding to the specified entry is specified as the deviation from the nominal width-to-height ratio for the font.

space — **returned by the graPHIGS API, short floating-point number**
> Character spacing corresponding to the specified entry is specified as a fraction of the font-nominal character height.

color — **returned by the graPHIGS API, fullword integer**
> Text color index corresponding to the specified entry.

> **Note:** Direct text color returns error indicator 526.

GPQTXF - Inquire Text Facilities

GPQTXF (*wstype*, *errind*, *npred*)

Purpose

Use **GPQTXF** to inquire the number of predefined text bundle table entries in the WDT for the specified workstation type.

The graPHIGS API returns a value indicating the number of predefined text indexes for the bundle table of the specified workstation type.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
> Workstation type.

errind — **returned by the graPHIGS API, fullword integer**
> Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

> | 23 | SPECIFIED WORKSTATION TYPE DOES NOT EXIST |
> |---|---|
> | 35 | WORKSTATION HAS ONLY INPUT CAPABILITIES |
> | 548 | SPECIFIED WORKSTATION TYPE CANNOT BE LOADED |

npred — **returned by the graPHIGS API, fullword integer**
> Number of predefined text bundle table entries.

GPQWCT - Inquire Workstation Connection and Type

> GPQWCT (*wsid*, *errind*, *connid*, *wstype*)

Purpose

Use **GPQWCT** to inquire the connection identifier and generic workstation type of the specified workstation identifier. The generic workstation type is the type that was developed from the Open Workstation (**GPOPWS**) subroutine or Create Workstation (**GPCRWS**) subroutine or the type that resulted from Nickname Default processing.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wsid — **specified by user, fullword integer**
    Workstation identifier.

errind — **returned by the graPHIGS API, fullword integer**
    Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

    25   SPECIFIED WORKSTATION DOES NOT EXIST

    533   INQUIRY DATA EXCEEDS AREA. OUTPUT TRUNCATED

connid — **returned by the graPHIGS API, 8-byte character string**
    Connection identifier.

        Note: It the connection identifier is >8 characters, then it is truncated and the *errind* parameter is set to 533.

wstype — **returned by the graPHIGS API, 8-byte character string**
    Generic workstation type.

GPQWCV - Inquire Workstation Configuration Variability

GPQWCV (*wstype*, *start*, *number*, *errind*, *totnum*, *flist*)

Purpose

Use **GPQWCV** to inquire the items that may vary based on the configuration of the specified workstation type.

The graPHIGS API returns a value indicating the total number of workstation dependent features and a list of their identifiers.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

wstype — **specified by user, 8-byte character string**
Workstation type.

start — **specified by user, fullword integer**
Starting member of the list of workstation variable features (>=1).

number — **specified by user, fullword integer**
Number of requested feature identifiers (>=0).

errind — **returned by the graPHIGS API, fullword integer**
Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

23	SPECIFIED WORKSTATION TYPE DOES NOT EXIST
538	START VALUE < ONE
539	REQUESTED NUMBER < ZERO
543	START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED
548	SPECIFIED WORKSTATION TYPE CANNOT BE LOADED

totnum — **returned by the graPHIGS API, fullword integer**
Total number of configuration-dependent features.

flist — **returned by the graPHIGS API, array of fullword integers.**
List of the configuration-dependent features. The output array must be large enough to contain the requested data.

The following items represent possible variable features:

01	Workstation category
02	Maximum display surface size in device coordinates
03	Maximum display surface size in addressable units
04	Number of definable view table entries
05	Polyline linetypes
06	Polyline line widths
07	Number of polyline bundle table entries
08	Polymarker marker types
09	Polymarker marker sizes
10	Number of polymarker bundle table entries

GPQWST - Inquire List of Available Workstation Types

GPQWST (*start*, *number*, *errind*, *maxopen*, *nwstype*, *wstype*)

Purpose

Use **GPQWST** to inquire a list of available generic workstation types that can be open on a nucleus with nucleus identifier=1.

The graPHIGS API returns a value indicating the number of workstation types and a list of those types.

If the inquired information is available, then the graPHIGS API sets the error indicator to zero and returns the values in the output parameters. If the error indicator is 543 (the start value exceeds the extent of the available data), then only the total number (*totnum*) parameter is set. If the inquired information is unavailable, then the error indicator (*errind*) contains an error number indicating the reason, and the values returned in the output parameters are unpredictable.

Parameters

start — **specified by user, fullword integer**
  Starting member of the list of workstation types (>=1).

number — **specified by user, fullword integer**
  Number of workstation types requested (>=0).

errind — **returned by the graPHIGS API, fullword integer**
  Error indicator. If the error indicator is zero, the request has been completed. Otherwise, one of the following errors exists:

  202   SPECIFIED NUCLEUS DOES NOT EXIST

  538   START VALUE < ONE

  539   REQUESTED NUMBER < ZERO

  543   START EXCEEDS DATA EXTENT. TOTAL NUMBER AVAILABLE RETURNED

maxopen — **returned by the graPHIGS API, fullword integer**
  Maximum number of workstations to which a structure store can be simultaneously associated.

nwstype — **returned by the graPHIGS API, fullword integer**
  Total number of available generic workstation types.

wstype — **returned by the graPHIGS API, array of 8-byte character strings**
  List of available generic workstation types. The output array must be large enough to contain the requested data.

GPTXR - Set Text Representation

GPTXR (*wsid*, *index*, *font*, *prec*, *factor*, *space*, *color*)

Purpose

Use **GPTXR** to set the given attribute values into the specified entry of the text bundle table.

If a precision is specified that is not supported by the workstation, that workstation substitutes the font's highest available precision.

Parameters

wsid — **specified by user, fullword integer**
    Workstation identifier.

index — **specified by user, fullword integer**
    Text bundle table index (>=1). Index of table entry to be loaded.

font — **specified by user, fullword integer**
    Text font (>=1).

prec — **specified by user, fullword integer**
    Text precision (1=STRING_PREC, 2=CHAR_PREC, 3=STROKE_PREC).

factor — **specified by user, short floating-point number**
    Character expansion factor (>0). Specifies the deviation of the character's width-to-height ratio from the ratio specified by the font designer.

space — **specified by user, short floating-point number**
    Character spacing between two adjacent characters. This is specified as a fraction of the character's height.

color — **specified by user, fullword integer**
    Text color index (>=0).

Error Codes

25	SPECIFIED WORKSTATION DOES NOT EXIST

GPVCH - Set View Characteristics

GPVCH (*wsid*, *view*, *window*, *near*, *far*, *shield*, *shldci*, *border*, *brdrci*, *active*)

Purpose

Use **GPVCH** to set the characteristics of the specified view. These characteristics include: clipping indicators, appearance of the viewport, and a value indicating whether or not the view is displayed.

The values specified are stored in the requested view table entries. The corresponding current values in the view table entry are set to the requested values when the workstation is updated.

The clipping indicators determine to which boundaries the contents of the view are clipped. The shielding indicator determines whether the content of lower priority views may be displayed within the boundaries of the specified view. The border indicator and color specify whether a border is to be drawn around the viewport, and if it is, its color. The view active flag determines whether the view and its contents are displayed.

Parameters

wsid — **specified by user, fullword integer**
> Workstation identifier.

view — **specified by user, fullword integer**
> View index (>=1). Index of view table entry to be loaded.

window — **specified by user, fullword integer**
> Window clipping indicator (1=NOCLIP, 2=CLIP).

near — **specified by user, fullword integer**
> Near clipping indicator (1=NOCLIP, 2=CLIP).

far — **specified by user, fullword integer**
> Far clipping indicator (1=NOCLIP, 2=CLIP).

shield — **specified by user, fullword integer**
> Shielding indicator (1=OFF, 2=ON).

shldci — **specified by user, fullword integer**
> Shielding color index (>=0).

border — **specified by user, fullword integer**
> View border indicator (OFF, 2=ON).

brdrci — **specified by user, fullword integer**
> Border color index (>=0).

active — **specified by user, fullword integer**
> View active flag for output (1=INACTIVE, 2=ACTIVE).

GPVMP2 - Set View Mapping 2

> **GPVMP2 (*wsid*, *view*, *window*, *viewpt*)**

Purpose

Use **GPVMP2** to set the requested window and viewport values (for *x* and *y*) to the specified values for the given view.

Other viewing parameters are automatically set with the **GPVMP2** subroutine and are calculated as follows:

- The *z* extents for the viewport are set to the *z* extents of the NPC range.
- The projection type is set to parallel.
- The projection reference point is placed on a line perpendicular to the center of the specified window. The *z* value of the projection reference point is set to one half of the maximum of the Umax-Umin and Vmax-Vmin.
- The view plane distance is set to zero.
- The far clipping plane is set to the negative of one-half the maximum of Umax-Umin and Vmax-Vmin.
- The near clipping plane is set to one-half of the maximum of Umax-Umin and Vmax-Vmin.

All current view mapping values are set to the requested values when the workstation is updated.

Parameters

wsid — **specified by user, fullword integer**
>   Workstation identifier.

view — **specified by user, fullword integer**
>   Index of view table entry to be modified (>=1).

window — **specified by user, 4 short floating-point numbers (VC)**
  Window limits (Umin, Umax, Vmin, Vmax).

viewpt — **specified by user, 4 short floating-point numbers (NPC)**
  Viewport limits (Xmin, Xmax, Ymin, Ymax).

Error Codes

GPVMP3 - Set View Mapping 3

GPVMP3 (*wsid*, *view*, *window*, *viewpt*, *type*, *point*, *dist*, *near*, *far*)

Purpose

Use **GPVMP3** to set the requested viewing parameters to the given values for the specified view. The current values are set to the requested values when the workstation is updated.

Parameters

wsid — **specified by user, fullword integer**
  Workstation identifier.

view — **specified by user, fullword integer**
  Index of view table entry to be modified (>=1).

window — **specified by user, 4 short floating-point numbers (VC)**
  Window limits (Umin, Umax, Vmin, Vmax).

viewpt — **specified by user, 6 short floating-point numbers (NPC)**
  Viewport limits (Xmin, Xmax, Ymin, Ymax, Zmin, Zmax).

type — **specified by user, fullword integer**
  Projection type (`1=PARALLEL`, `2=PERSPECTIVE`).

point — **specified by user, 3 short floating-point numbers (VC)**
  Projection reference point (*u*, *v*, *n*).

dist — **specified by user, short floating-point number (VC)**
  Distance of view plane from view reference point along the n-axis.

near — **specified by user, short floating-point number (VC)**
  Distance of near plane from view reference point along the n-axis.

far — **specified by user, short floating-point number (VC)**
　　　Distance of far plane from view reference point along the n-axis.

GPVMT2 - Set View Matrix 2

GPVMT2 (*wsid*, *view*, *matrix*)

Purpose

Use **GPVMT2** to load the requested view matrix into the specified view table entry.

The 3x3 matrix is expanded by the graPHIGS API into a 4x4 matrix as follows:

```
|a b c|          |a b 0 c|
|d e f|  ---->    |d e 0 f|
|g h i|           |0 0 1 0|
                  |g h 0 i|
```

The current value is set to the requested value when the workstation is updated.

When inquired, the matrix returned is the expanded 4 x 4 matrix.

Parameters

wsid — **specified by user, fullword integer**
　　　Workstation identifier.

view — **specified by user, fullword integer**
　　　Index of view table entry to be loaded (>=1).

matrix — **specified by user, 9 short floating-point numbers**
　　　View matrix.

For the input view matrix, the elements must be in the following order:

```
|m11 m12 m13|
|m21 m22 m23| ---> (m11,m12,m13,m21.....m33)
|m31 m32 m33|
```

Chapter 19. Distributed Application Processing (DAP)

The subroutines in this section initiate and terminate a distributed application process.

GPEXAP - Execute Application Process

> GPEXAP (*apid*, *ncid*, *size*, *namel*, *name*, *parmt*, *parml*, *parm*, *xferflag*, *useridl*, *userid*, *passwordl*, *password*)

Purpose

Use **GPEXAP** to execute a Distributed Application Process (DAP) through a connected nucleus on a local or remote node. Depending upon the value of the transfer and/or execute parameter (*xferflag*), the DAP specified through the *name* parameter either is executed if the DAP already resides on the node or is transferred to the nucleus's node and then is executed.

If the *xferflag* parameter is set to 2=TRANSFER_EXECUTE, then the *name* parameter is interpreted to be the path and filename of the DAP object code on the shell's file system. DAPs transferred to the 6095 nucleus's file system are loaded into memory. DAPs transferred to the RS/6000 nucleus's file system are placed in a unique temporary directory and erased when the DAP is terminated. By default this will be the **/tmp/.gP/** *xxxxx* directory where *xxxxx* is the concatenation of the nucleus identifier and the DAP resource identifier. This will insure that the path to the DAP is unique for all DAPs on a RS/6000. In order to provide the user control of the size of the directory that will contain the downloaded DAPs, you may override **/tmp/.gP/** with your own path by specifying the DAPPATH default in the External Defaults File (EDF) or by using the **-p** option of the gPinit command (see *The graPHIGS Programming Interface: Technical Reference* for information on the gPinit command).

If the *xferflag* parameter is set to 1=EXECUTE_ONLY, then the *name* parameter is interpreted to be the path and filename of the DAP object code on the nucleus's file system.

For DAPs targeted for the RS/6000, where the *xferflag* is set to either 1=EXECUTE_ONLY or 2=TRANSFER_EXECUTE, a *userid* and *password* on the nucleus's node must be provided for the operation to be performed. The DAPs must be prelinked with any required libraries.

For DAPs targeted for the IBM 6095, the *xferflag*, *userid*, and *password* parameters are ignored and the DAP is transferred and executed in a manner equivalent to the Initiate Application Process (**GPINAP**) subroutine. The DAPs must be prelinked with any required nonshared libraries. System memory with the specified size is allocated, the specified program module is loaded into the memory and the module is started with the passing of the specified data as its parameter. The program module must reside on a disk that is accessible from the shell as a single file with a format that can be loaded by the control program in the 6090.

As with the **GPINAP** subroutine, DAPs started with the **GPEXAP** subroutine can be terminated with the Terminate Application Process (**GPTMAP**) subroutine.

Parameters

apid — **specified by user, fullword integer**
    Application process identifier.

ncid — **specified by user, fullword integer**
    Nucleus identifier.

size — **specified by user, fullword integer**
    Size of the memory allocated for the application process in bytes (>=0) The size must be large

747

enough to contain the program module itself and all storage used by the application process. This parameter is ignored if the nucleus is running on a RS/6000.

namel — **specified by user, fullword integer**
> Length of the file name in bytes (0<=*namel*<=80).

name — **specified by user, variable length character string**
> Name of the file that contains the program module of the application process. If the *xferflag* parameter is set to 1=EXECUTE_ONLY, then *name* is interpreted to be the path and filename of the DAP object code on the nucleus's file system. If the *xferflag* parameter is set to 2=TRANSFER_EXECUTE, then *name* is interpreted to be the path and filename of the DAP object code on the shell's file system. This parameter looks like a Unix file descriptor which consists of a **[/path/]filename[.extension]**. Path is the route of directories through the file system. It is optional and is ignored for MVS and VM.
>
> Following is an example of a full file descriptor:
>
> **/dap/appl1.o**
> - path = **/dap/** which says go from the root directory to directory **dap**
> - filename = **appl1**
> - extension = **.o**
>
> If the xferflag parameter is set to 1=EXECUTE_ONLY, then the name is passed to the nucleus as specified by the application. If the xferflag parameter is set to 2=TRANSFER_EXECUTE, then the following rules apply to the *name* parameter depending on which system the shell is running:
> - AIX
>   - filename - The filename must be supplied.
>   - extension - The extension is optional.
>   - path - The path is optional. If the path is not included, then the default directory at the time of the execution of the function will be used.
> - MVS, MVS/XA
>   - filename - The filename must be supplied and it is a member name within a partition data set if the extension is included. If the extension is not included, then the filename is the DD-name of the partition data set.
>   - extension - The extension is optional. If specified it is the DD-name of the partition data set including the member filename.
>   - the recommended file format for DAP object files targeted for AIX is V or VB and for the 6095 is F or FB.
>   - the recommended record length for DAP object files targeted for AIX is 2052 and for the 6095 is 80.
> - VM/CMS
>   - filename - The filename must be supplied.
>   - extension - The extension is optional. If it is not included, then an extension of .COF is used.
>   - the filename.extension will be folded to upper case.
>   - the recommended file format for DAP object files targeted for AIX is V and for the 6095 is F.
>   - the recommended record length for DAP object files targeted for AIX is 8192 and for the 6095 is 80.

parmt — **specified by user, fullword integer**
> Format of the parameter data and method of passing it to the main entry point of the application process. The following options are available:
>
> **0 =** No parameters are to be passed to the application process. Parameters *parml* and *parm* are ignored.

1 = The parameter data consists of a single string. This string will be split into strings which contains no white space (blanks, newline, tabs, etc.) before being passed to the application process. The application entry point will receive two parameters. The first parameter will contain the number of strings resulting from the parsing operation described above. The second parameter will contain a list of pointers to each of the strings. The main entry declaration could be coded in ″C″ as follows:

```
void main( argc, argv )
   int    argc;
   char * argv[[default]
```

On a RS/6000, the path and filename of the executing DAP is:

```
arg[o]
```

The arguments specified by the *parm* parameter are:

```
arg[1..n]
```

On an IBM 6095 system, the arguments specified by the *parm* parameter are:

```
arg[0.. n]
```

2 = The parameter data contains arbitrary information which has content that is only understood by the application processes. A pointer to the data and the amount of data is passed to the application process when it is started. The main entry declaration could be coded in ″C″ as follows:

```
void main( parmlen, parmptr )
   int    parmlen;
   char * parmptr;
```

Note: This parameter is **not** supported by a nucleus running on a RS/6000 and if it is specified an error will be generated. For this option, it is the application's responsibility to perform character code, floating-point, and byte order conversion, if needed, between the two environments in which the application processes are executing.

parml **— specified by user, fullword integer**
Length of data to be passed to the process as its invocation parameter in bytes (>=0).

parm **— specified by user, variable length character or byte string**
Data to be passed to the process as its invocation parameter. The format of the data contained in this parameter is defined by *parmt*.

xferflag **— specified by user, fullword integer**
Transfer and/or execute flag (1=EXECUTE_ONLY, 2=TRANSFER_EXECUTE). Only option 2=TRANSFER_EXECUTE is valid if the nucleus is running on a IBM 6095 system.

useridl **— specified by user, fullword integer**
Length of *userid* string. This parameter is ignored if the nucleus is running on a IBM 6095 system.

userid **— specified by user, variable length character string**
Userid of a user on the nucleus's node. This parameter is ignored if the nucleus is running on a IBM 6095 system.

Notes:

1. The nucleus targeted to execute the DAP must be a remote nucleus and be enabled to support DAP execution (see gPinit in *The graPHIGS Programming Interface: Technical Reference*.

2. The userid specified though the *userid* parameter, does **not** have to be the userid under which the nucleus is running.

3. The DAP will be executed under the specified userid.

passwordl **— specified by user, fullword integer**
>   Length of *password* string. This parameter is ignored if the nucleus is running on a IBM 6095 system.

password **— specified by user, variable length character string**
>   The password corresponding to the userid supplied through the *userid* parameter. This parameter is ignored if the nucleus is running on an IBM 6095 system.

>   **Note:** Operating system passwords within the AFS system cannot be verified and will result in error 210. In AFS, only locally defined passwords are accessible to the graPHIGS nucleus for validation.

Error Codes

202   SPECIFIED NUCLEUS DOES NOT EXIST

GPINAP - Initiate Application Process

GPINAP (*apid*, *ncid*, *size*, *namel*, *name*, *parmt*, *parml*, *parm*)

Purpose

Use **GPINAP** to create an application process on a 6090.

System memory of the specified size is allocated, the specified program module is loaded into the memory and the module is started with the specified parameter data being passed.

This subroutine is applicable only to a nucleus running on a 6090. The program module must reside on a disk that is accessible from the shell as a single file with a format that can be loaded by the control program in the 6090. For details of the file format, see *The graPHIGS Programming Interface: Technical Reference*.

Parameters

apid — **specified by user, fullword integer**
>   Application process identifier.

ncid — **specified by user, fullword integer**
>   Nucleus identifier. The specified nucleus must be running on a 6090.

size — **specified by user, fullword integer**
>   Size of the memory allocated for the application process in bytes (>0). The size must be large enough to contain the program module itself and all storage used by the application process.

namel — **specified by user, fullword integer**
>   Length of the file name in bytes (0<*namel*<=80).

name — **specified by user, character string**
>   Name of the file that contains the program module of the application process. This parameter looks like a Unix file descriptor which consists of a **[path]/filename[extension]**. **Path** is the route of directories through the file system. It is optional and is ignored for MVS and VM.

>   Following is an example of a full file descriptor:

>   **/dap/appl1.o**
>   - path = **/dap** which says go from the root directory to directory **dap**
>   - filename = **appl1**
>   - extension = **.o**

>   The following rules apply to the *name* parameter depending on which system the shell is running:
>   - AIX

>   If you do not specify the path, then the graPHIGS API uses the default directory at the time of the execution of the subroutine.
>   - MVS, MVS/XA
>   - `filename` - The filename must be supplied and it is a member name within a partition data set if the extension is included. If the extension is not included, then the filename is the DD-name of the partition data set.
>   - `extension` - The extension is optional. If specified it is the DD-name of the partition data set including the member filename.
>   - VM/CMS
>   - `filename` - The filename must be supplied.
>   - `extension` - The extension is optional. If it is not included an extension of .COF will be used.
>   - the `filename.extension` will be folded to upper case.

parmt — **specified by user, fullword integer**
>   Format of the parameter data and method of passing it to the 'main' entry point of the application process. The following options are available:

>   **0 =**   No parameters are to be passed to the application process. Parameters *parml* and *parm* are ignored.

>   **1 =**   The parameter data consists of a single string. This string will be split into strings which

contain no white space (blanks, newline, tabs, etc.) before being passed to the application process. The application entry point will receive two parameters. The first parameter will contain the number of strings resulting from the parsing operation described above. The second parameter will contain a list of pointers to each of the strings. The main entry declaration could be coded in ″C″ as follows:

```
void main( argc, argv )
    int    argc;
    char * argv[[default]
```

2 = The parameter data contains arbitrary information which has content that is only understood by the application processes. A pointer to the data and the amount of data is passed to the application process when it is started. The main entry declaration could be coded in ″C″ as follows:

```
void main( parmlen, parmptr )
    int    parmlen;
    char * parmptr;
```

Note: For this option, it is the application's responsibility to perform character code, floating-point, and byte order conversion between the two environments in which the application processes are executing.

parml **— specified by user, fullword integer**
Length of data to be passed to the process as its invocation parameter in bytes (>=0).

parm **— specified by user, variable length character or byte string**
Data to be passed to the process as its invocation parameter. The format of the data contained in this parameter is defined by *parmt*.

Appendix A. Character Set and Font Identifiers

Character Set Identifiers are defined as follows:

1-100	Reserved for IBM-defined single-byte character codes.

	1-	US ENGLISH
	2-	UK ENGLISH
	3-	GERMAN
	4-	FRENCH
	5-	ITALIAN
	6-	KATAKANA
	7-	SWEDISH
	8-	MULTINATIONAL
	10-	ISO 8859-1 (LATIN-1)
	11-	ISO 8859-2 (CZECH)
	12-	ISO 8859-5 (CYRILLIC)

101-127	Reserved for your use for single-byte character sets (only for geometric text).
128-228	Reserved for IBM defined double-byte character codes.
128	KANJI (IBM-932 encoding)
129	HANGUL
130	TRADITIONAL CHINESE
131	UNICODE
132	SIMPLIFIED CHINESE
134	KANJI (IBM-943 encoding)
229-255	Reserved for your use for double-byte character sets (only for geometric text).

Font Identifiers

1-127	Reserved for IBM defined fonts within IBM-reserved character sets; available for your use in user-reserved character sets.
128-255	Reserved for your use (only for geometric text)

For more information, see *The graPHIGS Programming Interface: Understanding Concepts (POWER-based System Only)* and *The graPHIGS Programming Interface: Technical Reference (POWER-based System Only)*.

Appendix B. Error Processing

The specific errors detected by the graPHIGS API subroutines are listed with the appropriate subroutine syntax.

The graPHIGS API error numbers are divided into the following ranges:

ERRORS 1-899 BASE graPHIGS API
> Device-independent warnings and errors.

ERRORS 900-999 DEVICE SUPPORT
> Workstation specific warnings and errors.

ERRORS 1000-1299 SYSTEM SERVICE
> System service warnings and errors.

ERRORS 1300-1399 DAP
> Distributed application processing warnings and errors.

ERRORS 2000-2999 DEVICE DRIVER
> Device driver warning and errors.

The timing of notification of the error is controlled by several factors, such as deferral mode or availability of system resources. Although errors are listed with each subroutine, the error may actually be reported by the processing of another subroutine. For example:

- Errors detected within the nucleus may be reported to the application on later, unrelated subroutines.

- Errors in view specifications (such as error 522 when a view matrix specified on the Set View Mapping 3 [**GPVMP3**] [page GPVMP3 - Set View Mapping 3] subroutine is singular) may not be detected and reported to the application until the incorrect data is used by the Update Workstation (**GPUPWS**) [page GPUPWS - Update Workstation] subroutine.

- I/O errors may be reported on subroutines that do not appear to perform I/O, or may perform I/O that is unrelated to the reported I/O error.

- Since deferral mode affects the timing of workstation updates, error conditions in some subroutines may not be detected until later subroutines force an update. This can cause errors from the former subroutines to be reported to the application on the later, unrelated subroutines.

In addition, there are certain errors that, although possible on any graPHIGS API subroutine, are not listed with each subroutine. These errors are:

2	FUNCTION REQUIRES STATE PHOP
300	STORAGE REQUEST FAILED
520	ERROR QUEUE HAS OVERFLOWED
525	FUNCTION CANNOT BE CALLED IN ERROR STATE
556	ELEMENT EXCEEDS MAXIMUM ALLOWED SIZE
594	DATA EXCEEDS CONNECTION BUFFER SIZE
603	INTERNAL COMMUNICATIONS PROTOCOL ERROR
607	NUCLEUS IS DOWN LEVEL. VERSION @A1, RELEASE @A2.@A3 IS REQUIRED

For a complete description of these error messages, see *The graPHIGS Programming Interface: Messages and Codes (POWER-based System Only)*. In addition, messages from the workstation service routines (Messages 2000-2999) and/or system services (Messages 1000-1299) are possible on many subroutines. For additional information on errors and error processing states, see *The graPHIGS Programming Interface: Messages and Codes (POWER-based System Only)* and *The graPHIGS Programming Interface: Understanding Concepts (POWER-based System Only)*.

Appendix C. Error-to-Subroutine Reference

Appendix D. Notices

This information was developed for products and services offered in the U.S.A.
IBM may not offer the products, services, or features discussed in this document in other countries.
Consult your local IBM representative for information on the products and services currently available in
your area. Any reference to an IBM product, program, or service is not intended to state or imply that only
that IBM product, program, or service may be used. Any functionally equivalent product, program, or
service that does not infringe any IBM intellectual property right may be used instead. However, it is the
user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.
IBM may have patents or pending patent applications covering subject matter described in this document.
The furnishing of this document does not give you any license to these patents. You can send license
inquiries, in writing, to:
IBM Director of Licensing
IBM Corporation
North Castle Drive
Armonk, NY 10504-1785
U.S.A.

For license inquiries regarding double-byte (DBCS) information, contact the IBM Intellectual Property
Department in your country or send inquiries, in writing, to:
IBM World Trade Asia Corporation
Licensing

Tokyo 106, Japan

**The following paragraph does not apply to the United Kingdom or any other country where such
provisions are inconsistent with local law:** INTERNATIONAL BUSINESS MACHINES CORPORATION
PROVIDES THIS PUBLICATION "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR
IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF NON-INFRINGEMENT,
MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Some states do not allow disclaimer
of express or implied warranties in certain transactions, therefore, this statement may not apply to you.
This information could include technical inaccuracies or typographical errors. Changes are periodically
made to the information herein; these changes will be incorporated in new editions of the publication. IBM
may make improvements and/or changes in the product(s) and/or the program(s) described in this
publication at any time without notice.

IBM may use or distribute any of the information you supply in any way it believes appropriate without
incurring any obligation to you.

Licensees of this program who wish to have information about it for the purpose of enabling: (i) the
exchange of information between independently created programs and other programs (including this one)
and (ii) the mutual use of the information which has been exchanged, should contact:
IBM Corporation
Dept. LRAS/Bldg. 003
11400 Burnet Road
Austin, TX 78758-3498
U.S.A.
Such information may be available, subject to appropriate terms and conditions, including in some cases,
payment of a fee.
The licensed program described in this document and all licensed material available for it are provided by
IBM under terms of the IBM Customer Agreement, IBM International Program License Agreement or any
equivalent agreement between us.

Information concerning non-IBM products was obtained from the suppliers of those products, their
published announcements or other publicly available sources. IBM has not tested those products and

773

cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to the names and addresses used by an actual business enterprise is entirely coincidental.
