Preface

This guide explains how to configure and customize Bull System Manager Add-ons.

Note

The Bull Support Web site may be consulted for product information, documentation updates and service offers:

http://support.bull.com

Intended Readers

This guide is intended for use by System Administrators.

Highlighting

The following highlighting conventions are used in this guide:

Bold Identifies the following:

• Interface objects such as menu names, labels, buttons and icons.

File, directory and path names.

• Keywords to which particular attention must be paid.

Italics Identifies references such as manuals.

Monospace Identifies portions of program code, command lines, or messages

displayed in command windows.

< > Identifies parameters to be supplied by the user.

Commands entered by the user

System messages displayed on the screen

WARNING

A Warning notice indicates an action that could cause damage to a program, device, system or data.

Chapter 1. Bull System Manager Server Add-ons Concepts

1.1 Bull System Manager Overview

Bull System Manager monitoring is used for the following tasks:

- Monitoring machines: Bull System Manager checks if the hosts are accessible, using the ping command from the System Manager. The machines to be monitored are either specified by the Administrator or detected by a discovery mechanism.
- Monitoring specific elements of the hardware, Operating System, services and Internet such as Power Status, CPU load, memory usage, disk usage, number of users, processes and service execution, http and ftp services.

The administrator can define status thresholds (OK, WARNING, CRITICAL, UNKNOWN) for each element monitored. When an anomaly occurs or when there is a return to normal status, **alerts** (in a log file) and **notifications** (by e-mail, by Bull autocall and/or by SNMP traps) are generated.

Note

Hardware and OS monitoring for Bull Intel-Based platforms are provided by the Bull System Manager Server package, not by the Add-on packages.

Bull System Manager Server Add-ons extend Bull System Manager monitoring with links to third-party management tools for specific devices and/or specific system functionalities.

Note

These Server Add-ons packages extend the management server independently of the platform and/or OS type (storage, network, virtualization, framework, etc.).

Bull System Manager consists of three main components that can be deployed onto Windows and Linux systems:

- Management Server and Server Add-ons
- Management Console
- Management Agent.

Note

Management Agent component can also be installed onto AIX systems

Management Server and Server Add-ons

Provides the infrastructure and services responsible for the collection of and treatment of management data. Management Server must be installed on the server dedicated to management.

Management Console

Provides third-party management tools for the end-user station running the Bull System Manager console web GUI.

Management Agent

Provides instrumentation and administration tools for the servers monitored. Management Agent must be installed on each server that is to be monitored.

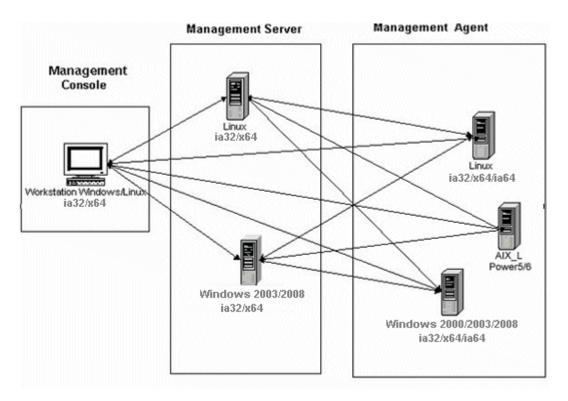

Figure 1-1. Bull System Manager Architecture

Note Bull System Manager for different operating systems is distributed on the same CD-ROM.

1.1.1 Monitoring Services

A **Service** (or monitoring service) defines how specific host elements are monitored. A service can be defined for all hosts or for a list of hosts, depending on the OS (Windows, Linux, AIX or any) and/or on the model. Notification properties are defined for each service.

Services are organized into monitoring **categories**. For instance, the **SystemLoad** category includes the **CPU** and **Memory** services for a Windows host.

1.1.2 Event Reception

Bull System Manager can receive **SNMP traps** from any SNMP agent. SNMP traps enable an agent to notify the Bull System Manager Server of significant events via a SNMP message. SNMP Traps must be defined in a **MIB** (Management Information Base).

1.1.3 Hardware Manager

A Hardware Manager manages hardware for one or more servers.

1.1.4 Storage Manager

A Storage Manager manages storage for one or more servers and/or bays.

1.1.5 Virtualization Manager

A **Virtualization Manager** manages a set of virtual machines, classed as a Virtualization Platform.

1.2 Bull System Manager Server Add-ons

Bull System Manager Server Add-ons include additional management packages to extend Bull System Manager Server.

A Bull System Manager Server Add-on provides functional links (monitoring, GUI call, reporting, etc.) between a Bull System Manager Server and a third-party management tool.

All the Server Add-ons are distributed on the Bull System Manager Server CD-ROM.

Note

There is a difference between Server Add-ons and the third-party management tools. Even if the third-party management tool is dedicated to an OS and/or a platform type, its Bull System Manager Server Add-on can be installed on a Bull System Manager Server machine (for example, on Linux and Windows, on IA32 and IA64, etc.).

This release provides several Bull System Manager Server Add-ons. Some of them are free and delivered on the Bull System Manager CD-ROM. The others must be purchased.

| System Domain | Server Add-on | | |
|---------------------------|------------------------------------|--|--|
| Internal Storage | LSI GAMTT Mgt Package | | |
| (BSM Server CD) | LSI CIM Mgt Package | | |

The Server Add-ons are described in the chapters that follow.

4

Chapter 2. Installing and Configuring BSM Server Add-ons

Before installing Bull System Manager, check that the environment meets the software and hardware requirements, described below.

2.1 General Installation Requirements

Supported Operating Systems

Bull System Manager Server Add-ons operate on Linux and Windows operating systems.

The principal requirement is the pre-installation of Bull System Manager Server. See Bull System Manager Installation Guide for details.

Required Disk Space

In general, each Server Add-on needs between 1 and 2 MB.

Required Memory

The following table indicates the required memory for the Management Server.

| Bull System Manager | Memory | | |
|---------------------|--------|--|--|
| Management Server | 2 GB | | |

Table 2-1. Bull System Manager - Required Memory

BSM Server Add-on Installation Requirements

| Server Add-ons | Component |
|----------------|----------------|
| * | BSMServer2.0-x |

Table 2-2. Management Server Add-ons Installation Requirements

BSM Server Add-on Operational Requirements

| Server Add-ons | Target Tools | | |
|----------------|---|--|--|
| BSMGAMTT | Linux GAM version 6.02.31 or higher. Windows GAM version 6.02-32 or higher. | | |
| | Important: Go to www.lsilogic.com to download the above versions. If not online, contact the Bull support team. | | |
| | Note: For IA32 machines the following earlier versions are supported: Linux GAM version 6.02-21 or higher Windows GAM version 6.02-22 or higher. | | |
| BSMLSICIM | LSI CIM provider version 3.06 or higher. Important: Go to www.lsilogic.com to download the above versions. If not on- | | |

| Server Add-ons | Target Tools | | |
|--------------------|---|--|--|
| | line, contact the Bull support team. | | |
| | Note: Not supported on Linux IA64 systems. | | |
| BSMMegaRaidSAS | LSI MegaRaid SAS (IR) SNMP agent version 3.09 or higher. | | |
| | Go to www.lsilogic.com to download the above versions. If not online, contact the Bull support team. | | |
| BSMStoreWayFDA | StoreWay FDA embedded SNMP Agent. | | |
| BSMEmcClariion | EMC Navisphere SNMP agent | | |
| BSMNetApp | NetApp embedded SNMP agent | | |
| BSMStoreWayDPA | StoreWay DPA embedded SNMP agent | | |
| BSMSwitchBrocade | Switch Brocade embedded SNMP agent | | |
| BSMDD4A | DDFA version 2.6.3 or higher | | |
| BSMVMwareVSphere | VMware Virtual Center 2.5 or higher | | |
| | VMware ESX 3.0 or higher | | |
| | Important: | | |
| | BSM Add-ons <u>use and include</u> the VI Perl toolkit API. On Windows platforms, the BSM Server uses ActivePerl with the VI Perl toolkit API (see requirements), but on Linux platforms, you have to install the required Perl packages for the VI Perl toolkit API. Go to the VMware documentation site to have the list of requirements http://www.vmware.com/support/developer/viperltoolkit/. If not on-line, contact the Bull support team. | | |
| BSMEscalaLPAR | IVM VIOS for Power5 and Power6 (Escala PL or EL Blade servers) or HMC version 6.1 and higher | | |
| BSMWaterCooledDoor | Device firmware: EMM release 1.1.0 build14 | | |
| BSMAPCPDU | APC Switch rack PDU AP7821, AP7921 and AP7922 with firmware release 3 and higher. | | |

Table 2-3. Management Server Add-ons Operational Requirements

2.1.1 Restrictions

Windows

N/A

Linux

N/A

2.2 Installing BSM Server Add-ons for Windows

Prerequisites

To install Bull System Manager Server Add-ons on Windows:

- The user must be a member of an Administrators group. The default administrator login is Administrator.
- The installation program requires the Internet Explorer web browser. Other browsers, such as Netscape or Mozilla, cannot be used to install Bull System Manager on Windows.
- Management Server Add-ons are to be installed on the server dedicated to management.
- Acrobat Reader is required to view PDF versions of the Bull System Manager documentation.
- The Server Add-ons are included on the Bull System Manager CD-ROM.

2.2.1 Installing Management Server Add-ons from the BSM CD-ROM

Management Server Add-ons, to be installed on the server dedicated to management, require the components indicated in 0 *BSM Server* Add-on Installation Requirements, and must be installed from the CD-ROM.

To install Management Server Add-ons from the CD-ROM:

- 1. From the dedicated server, launch the installation program.
- 2. Log on as Administrator.
- Insert the Bull System Manager CD-ROM in the drive.
 The installation program is launched automatically and opens the Welcome page.

Note If the installation does not start automatically, double-click <CD-ROM drive> / setup.exe.

Figure 2-1. Windows Installation - Bull System Manager Welcome Page

4. Click **Install Now** to open the **Install** page, which allows the selection of the required Bull System Manager components:

- Management Server Add-ons and provides the following information:
- What to install?
- What to do now?

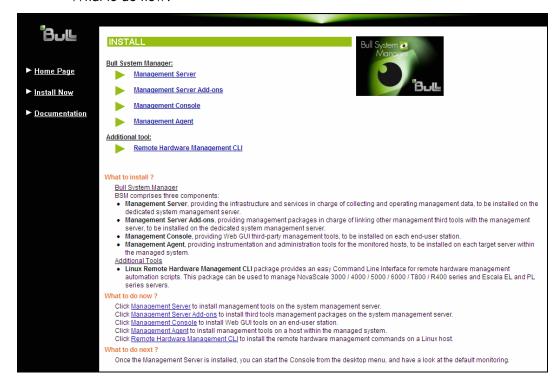

Figure 2-2. Windows Installation - Bull System Manager Install Page

Select Management Server Add-ons

Figure 2-3. Windows Installation - Selecting Bull System manager Server Add-ons

Select an Add-ons family (Storage, Virtualization, Bull Application or Other Devices), then Windows 32 bits operating system.

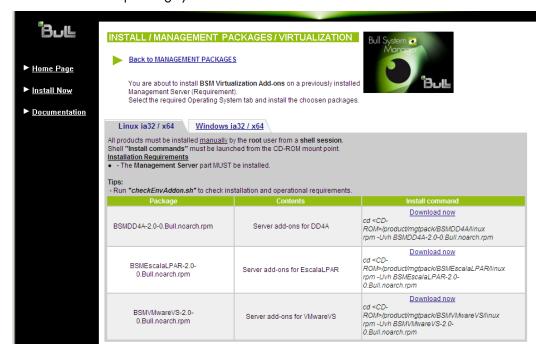

Figure 2-4. Windows Installation - Bull System Manager Server Add-ons Install Page

Click the corresponding Install Package Now link to install the Server Add-ons
package. The wizard prompts for a destination folder. The default value can be
changed if required.

At the end of the installation process, the Management Server Add-ons components are automatically operational.

2.2.2 Un-installing BSM Server Add-on Components

Un-installation operations must be launched locally. Launching the un-installation program removes all files and folders.

To un-install Bull System Manager Add-ons components:

- 1. From the Control Panel, launch Add/Remove Programs.
- 2. Select the required Bull System Manager Server Add-ons components and click **Remove**.

Note

After un-installation operations, customized categories from previous versions may remain in the configuration. These elements must be removed using the BSM Configuration GUI.

2.2.3 Upgrading to a New BSM Server Add-on Version

When upgrading to a new BSM Server Add-ons version, the existing BSM Server Add-ons environment that may have been customized is maintained.

BSM Server Add-ons are upgraded via the standard installation program.

Note

When you upgrade to a new of the BSM Management Server, you must also upgrade BSM Server Add-ons to benefit from new improvements.

See the Release Notes for more details about migrating specific Add-ons, where applicable.

2.3 Installing Bull System Manager Server Add-ons for Linux

2.3.1 Prerequisites

To install Bull System Manager Server Add-ons for Linux:

- The user must be logged as root.
- The installation program requires the Mozilla web browser (Version >1.4.3 or Firefox):
 If Mozilla is not installed, launch another web browser and open the file:

<CD-ROM Mount point>/product /index.html

It is advised to uninstall the previous version of Mozilla before installing a new version. This operation will not delete bookmarks, histories, cookies and other information stored in the profile directory.

The Mozilla directory must be set as a root PATH environment variable. If a previous version of Mozilla is still installed, the new Mozilla directory must be set at the beginning of the PATH variable.

- Management Server Add-ons must be installed on the server dedicated to management.
- Acrobat Reader is required to view PDF versions of the Bull System Manager documentation.
- The Server Add-ons are present on the Bull System Manager CD-ROM or on the Bull System Manager Add-ons CD-ROM.

Notes

 You can check if the required packages from a given Add-on are installed by launching.

```
cd <CD-ROM mount point>
/checkEnvAddon.sh -a <addOn>
```

- AddOn is the name of the RPM (BSM<addOnldent>.<version>.Bull) or the short addOnldemt
- The RPM packages listed above may have their own dependencies and require other RPM packages.
- If the RPM has been installed, the result of the checkEnvAddon is listed in the
 corresponding installation log (post_install_BSM<addonldent> log in the

 Installation>/engine/tmp/ directory

2.3.2 Installing Management Server Add-ons from the CD-ROM

Management Server Add-ons to be installed on the server dedicated to management, require the components indicated in *General Installation Requirements* in Section 2.1, and must be installed from the CD-ROM.

To install Management Server Add-ons from the CD-ROM:

From the dedicated server, launch the installation program.

Log on as root.

- Insert the Bull System Manager CD-ROM in the drive.
 The CD-ROM file system is automatically mounted as one of the following directories:
 - /mnt/cdrom or /mnt/dvd (Red Hat and Advanced Server distributions)
 - /media/cdrom or /media/dvd (SuSE distribution).
- 2. Launch the following commands:

```
cd <CD-ROM mount point>
./install.sh
```

The **install.sh** script automatically launches the Mozilla or Mozilla Firefox browser and opens the **Welcome** page.

Figure 2-5. Linux Installation - Bull System Manager Welcome Page

- 3. Click **Install Now** to open the **Install** page, which allows the required Bull System Manager components to be selected:
 - Management Server Add-ons and provides the following information:
 - What to install?
 - What to do now?

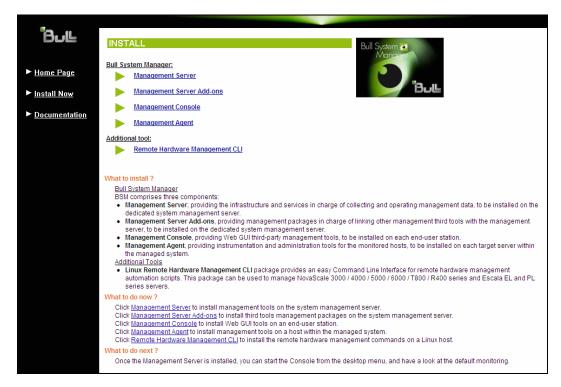

Figure 2-6. Linux Installation - Selecting Bull System Manager Components

4. Select Management Server Add-ons.

Figure 2-7. Linux Installation - Selecting Bull System Manager Server Add-ons

5. Select an Add-ons family (Storage, Virtualization, Bull Application or Other Devices), Select the Linux 32 bits operating system.

Figure 2-8. Linux Installation - Bull System Manager Server Add-ons Install page

6. Install the selected Bull System Manager Server Add-ons packages:

```
cd <CD-ROM mount point>/product/mgtpack/BSM<toolname>/linux rpm -Uhv BSM<toolname>-2.0-x.noarch.rpm
```

2.3.3 Uninstalling BSM Server Add-on Components

- 1. Log on as root.
- 2. Launch:

rpm -e BSM<toolname>-2.0-x.noarch.rpm

2.3.4 Upgrading to new Bull System Manager Server Add-on Versions

When upgrading to new Bull System Manager Server Add-on versions, the existing Bull System Manager Add-ons environment that may have been customized is maintained.

Bull System Manager Add-ons are upgraded via the standard rpm installation command:

rpm -Uhv BSM<toolname>-2.0-x.noarch.rpm

Note

When you upgrade the Bull System Manager Management Server, you MUST upgrade the previously installed server add-ons to benefit from new improvements.

See the *Release Notes* for more details about migrating specific add-ons, where applicable.

2.4 Monitoring Configuration

Configuring Bull System Manager Monitoring consists mainly in specifying the parameters required for monitoring tasks. Most configuration tasks are performed via the Bull System Manager Configuration GUI (Graphical User Interface).

Bull System Manager Server Add-ons extend the Monitoring configuration default rules that the Administrator can customize. New monitoring categories and services are provided.

2.4.1 GUI Configuration

Bull System Manager provides a GUI to perform the main configuration tasks.

Starting the Configuration GUI

To start the Configuration GUI, either:

- From the Bull System Manager Console, click the icon representing the Configuration GUI in the Administration zone (top right)
- Or click the Configuration link on the Bull System Manager Home Page, URL: http://<Bull System Manager server name>/BSM
- Or, from a web browser, go to the following URL:
 http://<Bull System Manager server name>/BSM/config/

2.4.2 Categories and Services

Bull System Manager Server Add-ons deliver more default monitoring categories and services. These categories and services depend on the Operating System running on the host:

- Services for Windows hosts will be applied to all hosts using a Windows Operating System
- Services for Linux hosts will be applied to all hosts using a Linux Operating System
- Services for hosts, independently of the Operating System, will be applied to all hosts.

The Administrator can change the default monitoring configuration by:

Customizing services, to define specific thresholds and monitoring properties or to
modify the list of monitored hosts. A service can be customized to create one or more
occurrences of this service with the same name. Each occurrence can have a different
host list and different monitoring properties. For instance, if you do not want to monitor
file systems in the same way on all Linux hosts, customize the All service in the
FileSystems category.

Note The Administrator CANNOT modify the OS and/or model type of these monitoring services and categories, as internal, tool semantic checks may reject such modifications.

- Cloning services, to define new elements monitored. One or more services are
 created, with different names from the original names. All properties can be edited
 except the check command. For instance, to monitor a specific logical drive on a
 Windows system, clone the C service and modify the check command parameters.
- Customizing categories, to restrict monitoring a whole category to a list of hosts.
- Creating a category, to assign a set of cloned services to this category.

See the *Bull System Manager Administrator's Guide* for more details about the configuration.

Chapter 3. BSM Server Add-ons

Bull System Manager Server Add-ons provide different functional items for each Management Package.

3.1 Internal Storage (Free)

The following Add-ons are used for monitoring internal storage.

3.1.1 BSM GAMTT for LSI MegaRAID 320-2x Management

GAMTT (or **GAM**) is the LSI tool used to survey, configure and control RAID provided by LSI MegaRAID Ultra320 SCSI cards.

See http://www.lsilogic.com/products/megaraid/index.html to download the GAMTT install package and for more information.

Note This tool runs on NovaScale machines under Linux or Windows.

The corresponding Bull System Manager Add-on creates monitoring links between Bull System Manager and the **GAM** SNMP agent.

The following figure shows the different monitoring components:

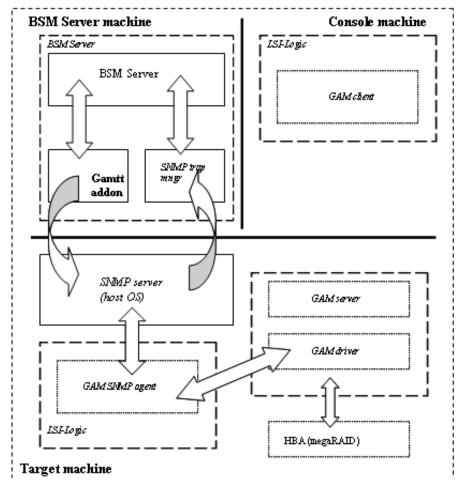

Figure 3-1. GAM Monitoring Components

3.1.1.1 Default Categories & Services (independent of OS type)

| Targeted OS | Model | Category | Service | Check command |
|-------------|-------|-----------|---------|-------------------------------|
| Any | any | GAMTTraid | Status | Check_gamttRAID |
| | | | Alerts | No check (SNMP trap receiver) |

Table 3-1. GAMTT monitoring services

Notes This category is based on the GAMTT management product from LSI. This tool and especially its SNMP interface is a requirement for the GAMTTraid monitoring services. Check that this tool works on the targeted OS, if you want to use it for monitoring in Bull System Manager. The previous MegaRAID category (NovaScale Master release 4.0) is based on the PowerConsolePlus management product from LSI. These two management products are functionally redundant but not compatible. So you need to replace the MegaRAID category and its services by the GAMTTraid category and services, if you replace PowerConsolePlus by GAMTT.

3.1.1.2 GAMTTraid Category

Status For NovaScale and Express5800 hosts with an LSI (or Mylex) SCSI RAID card

managed by GAMTT (or GAM) management tool. This service checks the Host

RAID status reported by the associated GAMTT SNMP agent.

Alerts For NovaScale and Express5800 hosts. When an alert is sent from the GAMTT

SNMP agent, it is processed by the Bull System Manager server.

Notes The mlxraid.mib is integrated in the Bull System Manager application.

Do not forget to configure the agent to send SNMP traps to the Bull System Manager server by adding the Bull System Manager server host address to the SNMP managers list for this agent.

3.1.1.3 check_gamttRAID (any OS) Nagios command

The configurable Bull System Manager service check command syntax is:

```
check_gamttRAID!<community>!<port>!<timeout>!{ [-A {ALL|<Ct>}] |
[-P {ALL|<Ct>.<Ch>.<Tg>}] | [-L {ALL|<Ct>.<Ldn>}] }
```

Input

<community> SNMP community string (defaults to "public")

<port> SNMP port (defaults to 161)

<ti>defaults to Nagios</ti>

timeout value)

-A, -adapter ALL | <Ct> Controller board

-P, -physical ALL | <Ct>.<Ch>.<Tg> Physical device addr

-L, -logical ALL | <Ct>.<Ldn> Logical drive addr

Output

See the output of the **check_gamttRAID** command in *Chapter 4*.

Default syntax for **GAMTraid.Status** (the service name as defined in Nagios configuration based on the category name and service name defined in BSM configuration)

check_gamttRAID!public!161!60!-A ALL

3.1.2 BSMLSICIM for LSI 22320 Chip Management

LSI CIM is the LSI tool used to survey, configure and control RAID provided by LSI MegaRAID 22320 SCSI cards.

See http://www.lsilogic.com/products/megaraid/index.html for more information or for downloading the LSI CIM install package.

Note This tool runs on NovaScale machines under Linux or Windows.

The corresponding Bull System Manager Add-on creates monitoring links between Bull System Manager and the **LSI CIM** provider.

The following figure shows the different monitoring components:

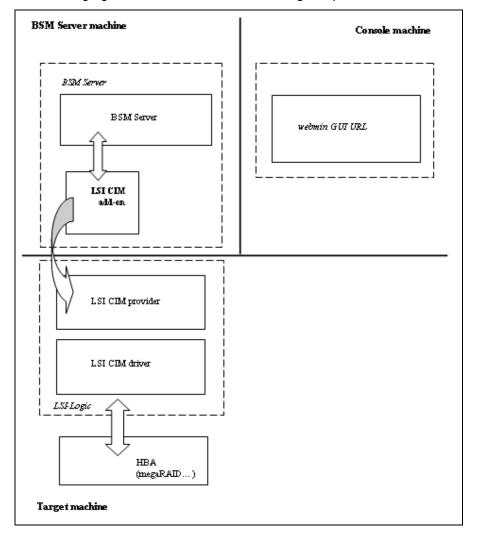

Figure 3-2. LSI CIM Monitoring Components

3.1.2.1 Default Categories & Services (independent of OS type)

| Targeted OS | Model | Category | Service | Check command |
|-------------|-------|----------|------------|-------------------|
| Any | Any | LsiCIM | RAIDStatus | check_LSICIM |
| | | | CTRLstatus | check_LSICIM_ctrl |

Table 3-2. LSI CIM monitoring services

Note

This category is based on the LSI CIM management product. This tool is a requirement for the following **LsiCIM** monitoring services. Check that this tool works on the targeted OS, if you want to use it for monitoring in Bull System Manager.

LsiCIM Category

RAIDstatus For NovaScale and Express5800 hosts with an LSI SCSI RAID card

managed by the LSI CIM management tool. This service checks the Host

RAID status reported by the associated LSI CIM provider.

CTRLstatus For NovaScale and Express5800 hosts with an LSI SCSI RAID card

managed by the LSI CIM management tool. This service checks the status of a specific RAID SCSI controller reported by the associated LSI CIM provider.

3.1.2.2 check_LSICIM (any OS) Nagios command

The configurable Bull System Manager service check command syntax is:

check_LSICIM

Input

N/A

Output

See the output of the check_LSICIM shell command in Chapter 4.

Default syntax for LsiCIM.CTRL.Status (the service name as defined in Nagios configuration based on the category name and service name defined in BSM configuration)

check_LSICIM

3.1.2.3 check_LSICIM_ctrl (any OS) Nagios command

The configurable Bull System Manager service check command syntax is:

check_LSICIM_ctrl![<ctrlname>]

Input

<ctrlname>

Name of the controller to check

Note

The name of the controller must be protected with a quotation mark if the name contains blank characters.

Output

See the output of the check_LSICIM shell command in Chapter 4.

Default syntax for **LsiCIM.CTRL.Status** (the service name as defined in Nagios configuration based on the category name and service name defined in BSM configuration)

check_LSICIM!'ctrlname'

3.1.3 BSM MegaRaidSAS (LSI MegaRAID SAS (IR) Management)

The corresponding Bull System Manager Add-on creates monitoring links between Bull System Manager and the LSI MegaRAID SAS(IR) SNMP agent.

It supports the adapters from MegaRAID SAS/SATA Value and Feature Line and the LSI SAS ICs 1064, 1068 and 1078.

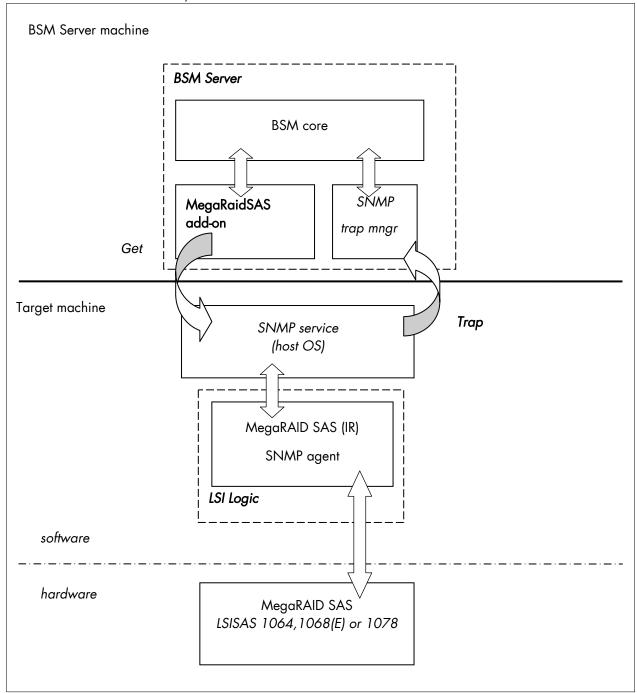

Figure 3-3. MegaRAID SAS Monitoring Components

3.1.3.1 Default Categories & Services (independent of OS type)

| Targeted OS | Model | Category | Service | Check command |
|-------------|-------|----------------|---------|-------------------------------|
| Any | Any | MegaRaidSAS | Status | check_MegaRAIDSAS |
| | | | Alerts | No check (SNMP trap receiver) |
| Any | Any | MegaRaidSAS_IR | Status | check_MegaRAIDSAS_IR |
| | | | Alerts | No check (SNMP trap receiver) |

Table 3-3. MegaRaid SAS (IR) monitoring services

Note This category is based on the MegaRAID SAS (IR) SNMP agent. This SNMP interface is a requirement for the following MegaRaidSAS(-IR) monitoring services.

3.1.3.2 MegaRaidSAS(_IR) Category

Status For NovaScale hosts with a MegaRAID SAS card or an integrated LSI SAS

chip managed by MegaRAID Storage Management tool. This service checks the MegaRAID SAS (IR) status reported by the MegaRAID SAS (IR) SNMP

agent.

Alerts For NovaScale hosts with a MegaRAID SAS card or an integrated LSI SAS

chip. When an alert is sent from the MegaRAID SAS (IR) SNMP agent, it is

processed by the Bull System Manager Server.

Notes The **Isi-adaptersas(ir).mib** is integrated in the Bull System Manager application.

Do not forget to configure the MegaRAID SAS (IR) SNMP agent to send SNMP traps to the Bull System Manager Server by adding the Bull System Manager Server host address to the agent's SNMP managers list.

3.1.3.3 check_MegaRaidSAS(_IR) (any OS) Nagios command

The configurable Bull System Manager service check command syntax is:

check_MegaRaidSAS(_IR)!<community>!<port>!<timeout>

See the **check_** MegaRaidSAS(_IR) command in *Chapter 4* for parameter details.

Default syntax for **MegaRaidSAS(_IR).Status** (the service name as defined in Nagios configuration based on the category name and service name defined in BSM configuration)

check_ MegaRaidSAS(_IR)!public!161!60

3.2 External Storage Server Add-ons

The following Add-ons are used for monitoring external storage.

3.2.1 BSMStoreWayFDA (StoreWay FDA Management)

The corresponding Bull System Manager Add-on creates monitoring links between Bull System Manager and the StoreWay FDA SNMP agent and WEB GUI.

It supports the StoreWay FDA and StoreWay Optima families.

Note

The access, through the BSM Console/Operations menu, to the administration Web GUI may not be operational for some StoreWay FDA or StoreWay Optima storage systems, due to a bug in their firmware release.

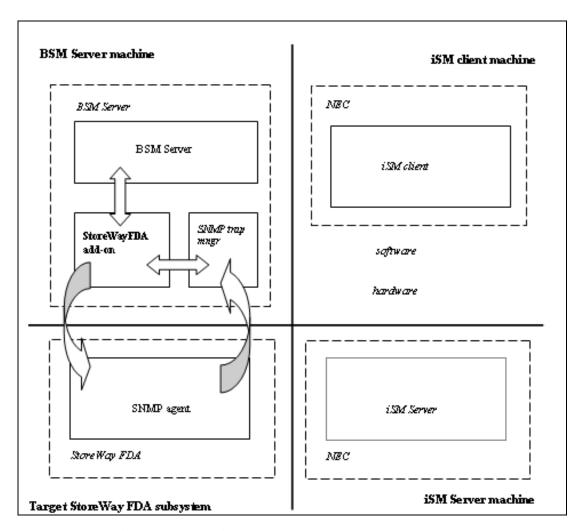

Figure 3-4. StoreWay FDA Monitoring Components

3.2.1.1 Default Categories & Services (independent of OS type)

| Targeted OS | Model | Category | Service | Check command |
|-------------|--------------------|-------------|---------|-------------------------------|
| Any | BayStoreWay FDA | StoreWayFDA | Status | check_NECFDA |
| | | | Alerts | No check (SNMP trap receiver) |

Table 3-4. StoreWay FDA monitoring services

Note This category is based on the StoreWay FDA SNMP agent. This SNMP interface is a requirement for the StoreWayFDA monitoring services.

3.2.1.2 StoreWayFDA Category

Status For StoreWay FDA hosts managed via SNMP agents. This service checks the

StoreWay FDA status reported by the SNMP agent.

Alerts For StoreWay FDA hosts. When an alert is sent from the StoreWay FDA

SNMP agent, it is processed by the Bull System Manager Server.

Notes The Armg2_4.mib is integrated in the Bull System Manager application.

Do not forget to configure the StoreWay FDA agent to send SNMP traps to the Bull System Manager Server by adding the Bull System Manager Server host address to the agent's SNMP managers list.

3.2.1.3 check_NECFDA (any OS) Nagios command

The configurable Bull System Manager service check command syntax is:

check_storewayfd!<timeout>

See the **check_NECFDA** command in *Chapter 4* for parameter details.

For HOSTADDRESS, SNMP community and SNMP port parameters, the Nagios macros \$HOSTADDRESS\$, \$_HOSTSNMP_COMMUNITY\$ and \$_HOSTSNMP_PORT\$ are used.

Default syntax for **StoreWayFDA.Status** (the service name as defined in Nagios configuration based on the category name and service name defined in BSM configuration)

check_necfda!60

3.2.1.4 Bull System Manager Configuration

StoreWay FDA configuration for Bull System Manager is available from the configuration GUI by selecting Topology \rightarrow StoreWay \rightarrow StoreWayFDAs.

To edit a StoreWay FDA, select Edit.

To define a new StoreWay FDA in the Bull System Manager configuration database, click the **New StoreWay FDA** button and initialize the following attributes:

StoreWay FDA name name of the StoreWay FDA

descriptiondescriptionnetwork namebay netname

snmp port numberSNMP port numbersnmp communitySNMP community

3.2.2 BSMEmcClariion (EMC CLARiiON Management)

The corresponding Bull System Manager Add-on creates monitoring links between Bull System Manager and the EMC Navisphere SNMP agent and web GUI.

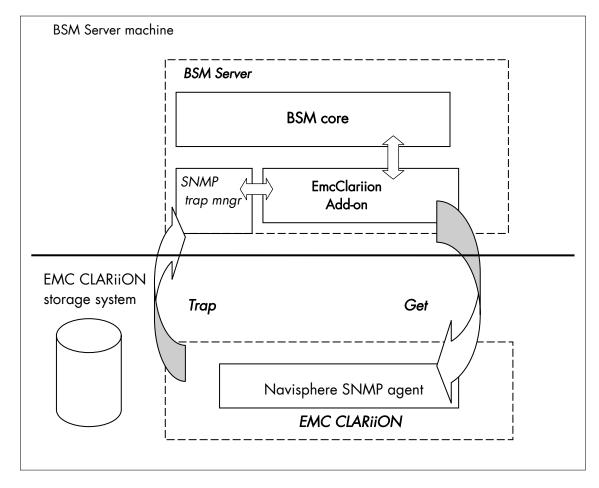

Figure 3-5. EMC CLARiiON Monitoring Components

3.2.2.1 Default Categories & Services (independent of OS type)

| Targeted OS | Model | Category | Service | Check command |
|-------------|----------------|-------------|---------|-------------------------------|
| Any | bayEmcClariion | EmcClariion | Alerts | No check (SNMP trap receiver) |
| | | | Status | check_EMCCLARIION |

Table 3-5. EmcClariion monitoring services

Note This category is based on the EMC Navisphere SNMP agent. This SNMP interface is a requirement for the EmcClariion monitoring services.

3.2.2.2 EmcClariion Category

Status For EMC CLARiiON hosts managed via Navisphere SNMP agent. This service

checks the EMC Clariion status reported by the SNMP agent.

Alerts For EMC CLARiiON hosts. When an alert is sent from the Navisphere SNMP

agent, it is processed by the Bull System Manager Server.

Notes The clariton.mib is integrated in the Bull System Manager application.

Do not forget to configure the Navisphere agent to send SNMP traps to the Bull System Manager Server by adding the Bull System Manager Server host address to the agent's SNMP managers list.

3.2.2.3 check_EMCCLARIION (any OS) Nagios command

The configurable Bull System Manager service check command syntax is:

check_EmcClariion!<community>!<port>!<timeout>

See the **check_ EMCCLARIION** command in *Chapter 4* for parameter details.

Default syntax for **EmcClariion.Status** (the service name as defined in Nagios configuration based on the category name and service name defined in BSM configuration).

check_EmcClariion!public!161!60

3.2.2.4 Bull System Manager Configuration

EmcClariion configuration for Bull System Manager is available from the configuration GUI by selecting **Topology** \rightarrow **StoreWay hosts** \rightarrow **EmcClariions**.

To edit an EmcClariion, select Edit.

To define a new EmcClariion in the Bull System Manager configuration database, click the **New EMC CLARIION** button and initialize the following attributes:

StoreWay EMC CLARiiON name name of the EMC CLARiiON

descriptiondescriptionnetwork namebay netname

SNMP port number SNMP port number

3.2.3 BSMNetApp (NetApp Management)

The corresponding Bull System Manager Add-on creates monitoring links between Bull System Manager and the NetApp SNMP agent and WEB GUI.

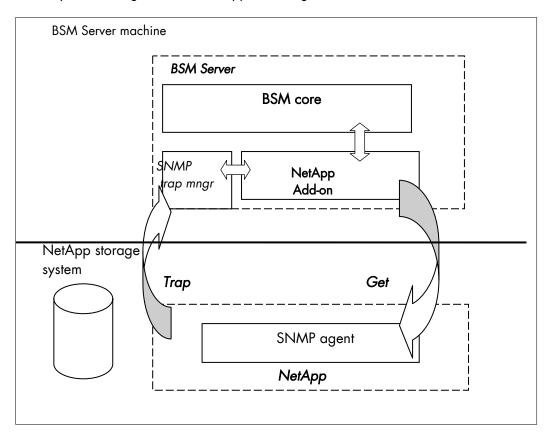

Figure 3-6. NetApp Monitoring Components

3.2.3.1 Default Categories & Services (independent of OS type)

| Targeted OS | Model | Category | Service | Check command |
|-------------|-----------|----------|--------------|-------------------------------|
| any | bayNetApp | NetApp | Alerts | No check (SNMP trap receiver) |
| | | | CPULoad | check-netapp-cpuload |
| | | | Disks | check-netapp-numdisks |
| | | | Fans | check-netapp-failedfans |
| | | | GlobalStatus | check_netapp_globalstatus |
| | | | Power | check-netapp-failedpwr |
| | | | RAIDStatus | check_netappraid |
| | | | VolumeStatus | check_netappvol |

Table 3-6. NetApp monitoring services

Note This category is based on the NetApp SNMP agent. This SNMP interface is a requirement for the NetApp monitoring services.

3.2.3.2 NetApp Category

CPULoad For NetApp hosts managed via SNMP agents. This service checks the

NetApp CPU load reported by the SNMP agent.

Disks For NetApp hosts managed via SNMP agents. This service checks the

status of the NetApp disks reported by the SNMP agent.

Fans For NetApp hosts managed via SNMP agents. This service checks the

status of the NetApp fans reported by the SNMP agent.

GlobalStatus For NetApp hosts managed via SNMP agents. This service checks the

NetApp Global Status reported by the SNMP agent.

Power For NetApp hosts managed via SNMP agents. This service checks the

status of the NetApp power supplies reported by the SNMP agent.

RAIDStatus For NetApp hosts managed via SNMP agents. This service checks the

NetApp RAID status reported by the SNMP agent.

VolumeStatus For NetApp hosts managed via SNMP agents. This service checks the

NetApp volume status reported by the SNMP agent.

Alerts For NetApp hosts. When an alert is sent from the NetApp SNMP agent, it

is processed by the Bull System Manager Server.

Notes The netapp.mib is integrated in the Bull System Manager application.

Do not forget to configure the NetApp agent to send SNMP traps to the Bull System Manager Server by adding the Bull System Manager Server host address to the agent's SNMP managers list.

3.2.3.3 Reporting Indicators

A reporting indicator is defined for the CPU load of the NetApp storage system. It gets values from the corresponding monitoring service.

Indicator applied to the NetApp Host

| Indicator | Corresponding Service |
|-------------------------------------|-----------------------|
| <netapp_host>_CPULoad</netapp_host> | CPULoad |

3.2.3.4 Nagios check commands

check-netapp-cpuload (any OS) Nagios command

The Bull System Manager service check command syntax is:

```
check_snmp -C public -o .1.3.6.1.4.1.789.1.2.1.3.0 -w 90 -c 95 -u '%' -l "CPU LOAD"
```

See the **check-netapp-cpuload** command in *Chapter 4* for details.

check-netapp-numdisks (any OS) Nagios command

The Bull System Manager service check command syntax is:

```
check_snmp -C public -o .1.3.6.1.4.1.789.1.6.4.1.0,
    .1.3.6.1.4.1.789.1.6.4.2.0, .1.3.6.1.4.1.789.1.6.4.8.0,
    .1.3.6.1.4.1.789.1.6.4.7.0 -u 'Total Disks','Active','Spare','Failed' -l
"""
```

See the **check-netapp-numdisks** command in *Chapter 4* for details.

check-netapp-failedfans (any OS) Nagios command

```
The Bull System Manager service check command syntax is:
```

```
check_snmp -C public -o .1.3.6.1.4.1.789.1.2.4.3.0 -l "Fans"
```

See the **check-netapp-failedfans** command in *Chapter 4* for details.

check_netapp_globalstatus (any OS) Nagios command

The configurable Bull System Manager service check command syntax is:

```
check_NetAppGlobalStatus!<community>!<port>!<timeout>
```

See the **check_netapp_globalstatus** command in *Chapter 4* for parameter details.

Default syntax for **NetApp.GlobalStatus**: (the service name as defined in Nagios configuration based on the category name and service name defined in BSM configuration)

```
check_ NetAppGlobalStatus!public!161!60
```

check-netapp-failedpwr (any OS) Nagios command

```
The Bull System Manager service check command syntax is:
```

```
check_snmp -C public -o .1.3.6.1.4.1.789.1.2.4.5.0 -l "Power"
```

See the **check-netapp-failedpwr** command in *Chapter 4* for details.

check_netappraid (any OS) Nagios command

The configurable Bull System Manager service check command syntax is:

```
check_NetAppRaid!<community>!<port>!<timeout>
```

See the **check_netappraid** command in *Chapter 4* for parameter details.

Default syntax for **NetApp.RAIDStatus**: (the service name as defined in Nagios configuration based on the category name and service name defined in BSM configuration)

```
check_NetAppRaid!public!161!60
```

check_netappvol (any OS) Nagios command

The configurable Bull System Manager service check command syntax is:

```
check_NetAppVol!<community>!<port>!<timeout>
```

See the **check_netappvol** command in *Chapter 4* for parameter details.

Default syntax for **NetApp.VolumeStatus**: (the service name as defined in Nagios configuration based on the category name and service name defined in BSM configuration)

```
check_NetAppVol!public!161!60
```

3.2.3.5 Bull System Manager Configuration

NetApp configuration for Bull System Manager is available from the configuration GUI by selecting **Topology** \rightarrow **StoreWay hosts** \rightarrow **NetApps**.

To edit a NetApp, select Edit.

To define a new NetApp in the Bull System Manager configuration database, click the **New NetApp** button and initialize the following attributes:

StoreWay NetApp name name of the NetApp

descriptiondescriptionnetwork namebay netname

SNMP port numberSNMP port numberSNMP communitySNMP community

3.2.4 BSMStoreWayDPA (StoreWay DPA Management)

The corresponding Bull System Manager Add-on creates monitoring links between Bull System Manager and the StoreWay DPA SNMP agent and WEB GUI.

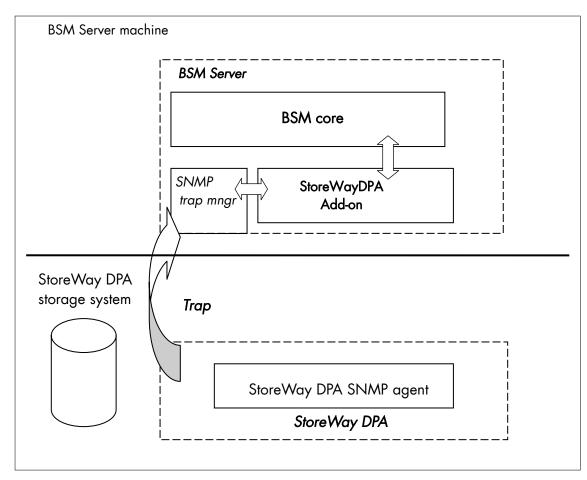

Figure 3-7. StoreWayDPA Monitoring Components

3.2.4.1 Default Categories & Services (independent of OS type)

| Targeted OS | Model | Category | Service | Check command |
|-------------|----------------|-------------|------------|-------------------------------|
| Any | bayStoreWayDPA | StoreWayDPA | Alerts | No check (SNMP trap receiver) |
| | | | TaskStatus | check_StoreWayDPA |

Table 3-7. StoreWayDPA monitoring services

Note This category is based on the StoreWay DPA SNMP agent. This SNMP interface is a requirement for the StoreWayDPA monitoring services.

3.2.4.2 StoreWayDPA Category

TaskStatus For StoreWay DPA hosts managed via its SNMP agent. This service checks

the StoreWay DPA Backup Engine and Task Launcher status reported by the

SNMP agent.

Alerts For StoreWay DPA hosts. When an alert is sent from the StoreWay DPA

SNMP agent, it is processed by the Bull System Manager Server.

Notes • The storewaydpa.mib is integrated in the Bull System Manager application.

 Do not forget to configure the StoreWay DPA agent to send SNMP traps to the Bull System Manager Server by adding the Bull System Manager Server host address to the agent's SNMP managers list.

3.2.4.3 Nagios check commands

Check_StoreWayDPA (any OS) Nagios command

The Bull System Manager service check command syntax is:

check_StoreWayDPA!<community>!<port>!<timeout>

See the **check_ StoreWayDPA** command in *Chapter 4* for parameter details.

Default syntax for **StoreWayDPA.TaskStatus** (the service name as defined in Nagios configuration based on the category name and service name defined in BSM configuration)

check_ StoreWayDPA!public!161!60

3.2.4.4 Bull System Manager Configuration

StoreWayDPA configuration for Bull System Manager is available from the configuration GUI by selecting **Topology** \rightarrow **StoreWay hosts** \rightarrow **StoreWayDPAs**.

To edit a StoreWayDPA, select Edit.

To define a new StoreWayDPA in the Bull System Manager configuration database, click the **New StoreWay DPA** button and initialize the following attributes:

StoreWay StoreWay DPA name name of the StoreWay DPA

descriptiondescriptionnetwork namebay netnameSNMP port numberSNMP port numberSNMP communitySNMP community

3.2.5 BSM SwitchBrocade (Brocade Fibre Channel Switch Management)

The corresponding Bull System Manager Add-on creates monitoring links between Bull System Manager and the Brocade Fibre Channel Switch SNMP agent and WEB GUI.

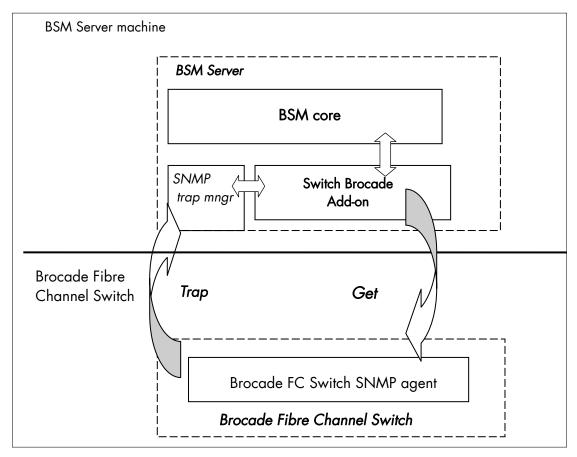

Figure 3-8. Brocade Fibre Channel Switch Monitoring Components

3.2.5.1 Default Categories & Services (independent of OS type)

| Targeted OS | Model | Category | Service | Check command |
|-------------|------------------|----------|---------|-------------------------------|
| Any | baySwitchBrocade | Brocade | Alerts | No check (SNMP trap receiver) |
| | | | Status | check_brocade |
| | | | Ports | check_brocade |

Table 3-8. Default Brocade Fibre Channel Switch monitoring services

Note

This category is based on the Brocade Fibre Channel Switch SNMP agent. This SNMP interface is a requirement for the default Brocade Fibre Channel Switch monitoring services.

3.2.5.2 Optional Categories & Services (independent of OS type)

| Targeted OS | Model | Category | Service | Check command |
|-------------|------------------|-----------------|---------|---------------|
| Any | baySwitchBrocade | Brocade_Sensors | Fans | check_brocade |
| | | | Temp | check_brocade |

Table 3-9. Optional Brocade Fibre Channel Switch monitoring services

Note

This category is based on the Brocade Fibre Channel Switch SNMP agent. This SNMP interface is a requirement for the optional Brocade Fibre Channel Switch monitoring services.

3.2.5.3 Brocade Category

Status For SwitchBrocade hosts managed via its SNMP agent. This service checks the

Brocade Fibre Channel Switch global status reported by the SNMP agent.

Ports For SwitchBrocade hosts managed via its SNMP agent. This service checks

each Brocade Fibre Channel Switch port status reported by the SNMP agent.

Alerts For SwitchBrocade hosts. When an alert is sent from the Brocade Fibre

Channel Switch SNMP agent, it is processed by the Bull System Manager

Server.

Notes • The SW-MIB.mib and SW-TRAP.mib files are integrated in the Bull System Manager

application.

 Do not forget to configure the Brocade Fibre Channel Switch snmp agent to send SNMP traps to the Bull System Manager Server by adding the Bull System Manager Server host address to the agent's SNMP managers list.

3.2.5.4 Brocade_Sensors Category

Fans For SwitchBrocade hosts managed via SNMP agents. This service checks each

Brocade Fibre Channel Switch fan status reported by the SNMP agent.

Temp For SwitchBrocade hosts managed via SNMP agents. This service checks each

Brocade Fibre Channel Switch temperature sensor status reported by the

SNMP agent.

3.2.5.5 Nagios check commands

check_brocade (any OS) Nagios command

The Bull System Manager service check command syntax is:

check brocade!<sensor>

values available for <sensor> are:

- switch
- port
- fan
- temp

See the **check_ brocade** command in *Chapter 4* for parameter details.

For HOSTADDRESS, SNMP community and SNMP port parameters, the Nagios macros \$HOSTADDRESS\$, \$_HOSTSNMP_COMMUNITY\$ and \$_HOSTSNMP_PORT\$ are used.

3.2.5.6 Bull System Manager Configuration

SwitchBrocade configuration for Bull System Manager is available from the configuration GUI by selecting **Topology** \rightarrow **StoreWay hosts** \rightarrow **SwitchBrocade**.

To edit a SwitchBrocade, select Edit.

To define a new SwitchBrocade in the Bull System Manager configuration database, click the **New SwitchBrocade** button and initialize the following attributes:

Switch Brocade name name of the Brocade Fibre Channel Switch

description description

network name bay netname

SNMP port number SNMP port number SNMP community SNMP community

3.2.5.7 Configuration of optional Brocade_Sensors category

The configuration of the optional Brocade_Sensors category for SwitchBrocade hosts is available from the configuration GUI by selecting Supervision \rightarrow Monitoring \rightarrow Categories/Services-> manage categories.

This opens a new Window. Select Add from an unused category template and check the **Brocade_Sensors** category. Then click on Add from the selected category.

Add the SwitchBrocade hosts to the hostlist and click on **OK**. Validate the new configuration by clicking on **Save & Reload**.

3.3 External Device Server Add-ons

The following Add-ons are used for monitoring external devices.

3.3.1 BSM WaterCooledDoor (Water Cooled Door Management)

The corresponding Bull System Manager Add-on creates monitoring links between Bull System Manager and the Baseboard Management Controller of the Bull Water Cooled Door device and its web GUI.

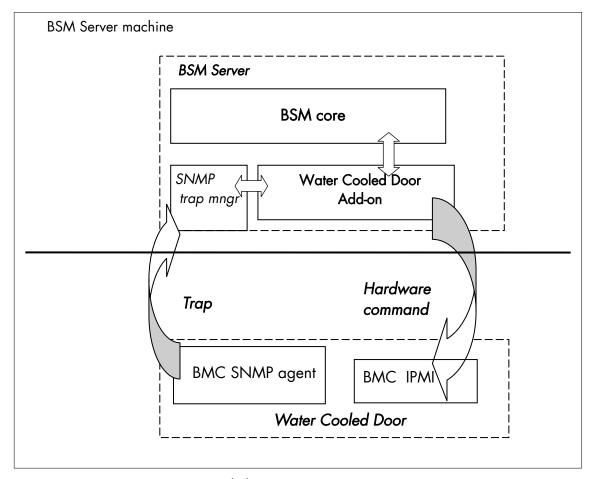

Figure 3-9. Water Cooled Door Monitoring Components

3.3.1.1 Default Categories & Services (independent of OS type)

| Targeted OS | Model | Category | Service | Check command |
|----------------|--------------------|----------|--------------------|-------------------------------|
| any | devWaterCooledDoor | Hardware | Alerts | No check (SNMP trap receiver) |
| | | | CoolingStatus | check_wcd_coolstatus |
| | | Power | PowerStatus | check_IPMI_powerstatus |
| | | Sensors | CurrentPower | check_IPMI_sensor |
| | | | DeltaPressure | check_pressure |
| | | | TemperatureAverage | check_IPMI_sensor |
| | | | ValveAperture | check_IPMI_sensor |

Table 3-10. Default Water Cooled Door monitoring services

3.3.1.2 Optional Categories & Services (independent of OS type)

| Targeted OS | Model | Category | Service | Check command |
|----------------|--------------------|----------|-------------------|-------------------|
| any | devWaterCooledDoor | Sensors | OutputTemperature | check_IPMI_sensor |
| | | | FanSpeed | check_IPMI_sensor |

Table 3-11. Optional Water Cooled Door monitoring services

Note These categories are based on the IPMI Hardware commands. The IPMI interface is a requirement for the WaterCooledDoor monitoring services.

3.3.1.3 Hardware Category

CoolingStatus For WaterCooledDoor hosts managed via IPMI Hardware commands. This

service checks the WaterCooledDoor cooling status reported by the BMC.

Alerts For WaterCooledDoor hosts. When an alert is sent from the

WaterCooledDoor SNMP agent, it is processed by the Bull System

Manager Server.

Note The WaterCooledDoorMIB.mib is integrated in the Bull System Manager application. The Alerts service inherits also from the bmclanpet.mib, which is also integrated in the Bull

System Manager application.

3.3.1.4 **Power Category**

PowerStatus For WaterCooledDoor hosts managed via IPMI hardware commands. This

service checks the WaterCooledDoor power status reported by the BMC.

3.3.1.5 **Sensors Category**

CurrentPower For WaterCooledDoor hosts managed via IPMI Hardware commands.

This service checks the power consumption of the WaterCooledDoor

reported by the BMC.

DeltaPressure For WaterCooledDoor hosts managed via IPMI Hardware commands.

This service checks the in/out pressure difference of the water circuit

of the WaterCooledDoor reported by the BMC.

For WaterCooledDoor hosts managed via IPMI Hardware commands. TemperatureAverage

This service checks the temperature average of the different

temperature sensors of the WaterCooledDoor reported by the BMC.

ValveAperture For WaterCooledDoor hosts managed via IPMI Hardware commands.

This service checks the cooled water circuit valve aperture reported by

the BMC.

OutputTemperature For WaterCooledDoor hosts managed via IPMI Hardware commands.

This service checks one of the external temperature sensors of the

WaterCooledDoor reported by the BMC.

FanSpeed For WaterCooledDoor hosts managed via IPMI Hardware commands.

This service checks the speed of one upon several fans reported by

the BMC.

Note Do not forget to configure the BMC's SNMP agent to send SNMP traps to the Bull System

Manager Server by adding the BSM Server host address to the SNMP managers list.

3.3.1.6 **Reporting Indicators**

Performance indicators are defined for the monitoring services of APC Power Distribution Unit listed below. They get values from the corresponding monitoring service. Performance indicators are collected by analyzing performance data provided by Nagios plug-in with PNP4Nagios.

PNP4Nagios is delivered as a BSM Server Extension and its installation is optional.

Indicators applied to the WaterCooledDoor Host

| Indicator | Corresponding Service |
|--|----------------------------|
| <watercooleddoor_host>_CurrentPower (watts)</watercooleddoor_host> | Sensors.CurrentPower |
| <watercooleddoor_host>_DeltaPressure (Pa)</watercooleddoor_host> | Sensors.DeltaPressure |
| <watercooleddoor_host>_TemperatureAverage (degrees C)</watercooleddoor_host> | Sensors.TemperatureAverage |
| <watercooleddoor_host>_ValveAperture (%)</watercooleddoor_host> | Sensors.ValveAperture |

Optional Indicators applied to the WaterCooledDoor Host

| Indicator | Corresponding Service |
|---|---------------------------|
| <watercooleddoor_host>_FanSpeed (RPM)</watercooleddoor_host> | Sensors.FanSpeed |
| <watercooleddoor_host>_OutputTemperature (degrees C)</watercooleddoor_host> | Sensors.OutputTemperature |

3.3.1.7 Nagios check commands

check_IPMI_powerstatus (any OS) Nagios command

The Bull System Manager service check command syntax is:

check_IPMILAN_powerstatus

See the check_IPMI_powerstatus command in Chapter 4 for details.

check_pressure (any OS) Nagios command

The Bull System Manager service check command syntax is:

check_sensor!'Air Pressure'

See the **check-sensor** command in *Chapter 4* for details.

check_IPMI_sensor (any OS) Nagios command

The configurable Bull System Manager service check command syntax is:

check_sensor!<sensor>

See the **check_sensor** command in *Chapter 4* for parameter details.

3.3.1.8 Bull System Manager Configuration

The WaterCooledDoor configuration for Bull System Manager is available from the configuration GUI by selecting **Topology** \rightarrow **Device hosts** \rightarrow **WaterCooledDoors**.

To edit a WaterCooledDoor, select Edit.

To define a new WaterCooledDoor in the Bull System Manager configuration database, click the New Water Cooled Door button and initialize the following attributes:

Water Cooled Door name Name of the Water Cooled Door

description Description

network name Address IP of Water Cooled Door's BMC

user User name to access the BMC

password Password associated to the user name

3.3.2 BSM PDU-APC (APC Power Distribution Unit Management)

The corresponding Bull System Manager Add-on creates monitoring links between Bull System Manager and the APC Power Distribution Unit SNMP agent and WEB GUI.

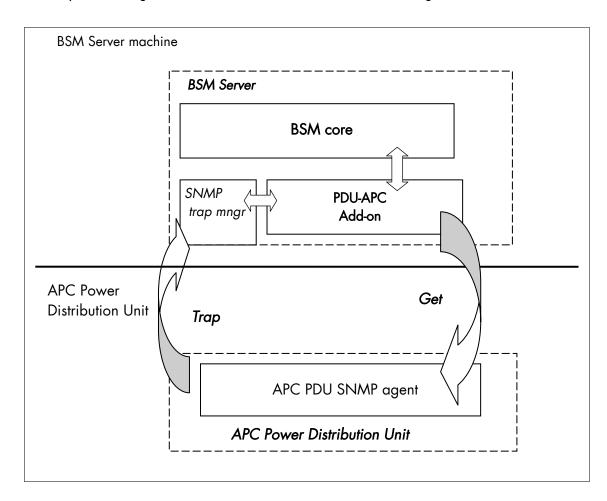

Figure 3-10 APC Power Distribution Unit Monitoring Components

3.3.2.1 Default Categories & Services (independent of OS type)

| Targeted OS | Model | Category | Service | Check command |
|-------------|-----------|----------|-------------|-------------------------------|
| Any | devPDUAPC | PDUAPC | Alerts | No check (SNMP trap receiver) |
| | | | Status | check_pduapc_status |
| | | Power | Consumption | check_pduapc_pwr_consumption |
| | | | Outlets | check_pduapc_outlets |

Table 3-12. Default APC Power Distribution Unit monitoring services

Note This category is based on the APC Power Distribution Unit SNMP agent. This SNMP interface is a requirement for the default APC Power Distribution Unit monitoring services.

3.3.2.2 PDUAPC Category

Alerts For APC PDU hosts. When an alert is sent from the APC PDU SNMP agent, it

is processed by the Bull System Manager Server.

Status For APC PDU hosts managed via its SNMP agent. This service checks the APC

PDU power supplies status reported by the SNMP agent.

Notes The **powernet398.mib** file are integrated in the Bull System Manager application. The trap severity SEVERE was changed to CRITICAL

Do not forget to configure the APC PDU SNMP agent to send SNMP traps to the Bull System Manager Server by adding the Bull System Manager Server host address to the agent's SNMP managers list.

3.3.2.3 Power Category

Consumption For APC PDU hosts managed via SNMP agents. This service checks

the global power consumption (in Watts) for each APC PDU.

Outlets For APC PDU hosts managed via SNMP agents. This service checks

each APC PDU outlet status reported by the SNMP agent.

3.3.2.4 Performance Indicators

Performance indicators are defined for the monitoring services of APC Power Distribution Unit listed below. They get values from the corresponding monitoring service. Performance indicators are collected by analyzing performance data provided by Nagios plug-in with PNP4Nagios.

PNP4Nagios is delivered in as BSM Server Extension and its installation is optional.

| Indicators | Corresponding Service |
|------------|-----------------------|
| watts | Power.Consumption |

Table 3-13. Performance Indicators applied to the APC PDU Host

3.3.2.5 Nagios check commands

check_PDUAPC (any OS) Nagios command

The Bull System Manager service check command syntax is:

check_PDUAPC!<action>!

Values available for <action> are:

- Status
- Consumption
- Outlets

See the check_ PDUAPC command in Chapter 4 for parameter details.

For HOSTADDRESS, SNMP community and SNMP port parameters, the Nagios macros \$HOSTADDRESS\$, \$_HOSTSNMP_COMMUNITY\$ and \$_HOSTSNMP_PORT\$ are used.

3.3.2.6 Bull System Manager Configuration

APC PDU configuration for Bull System Manager is available from the configuration GUI by selecting **Topology** \rightarrow **Device hosts** \rightarrow **PDUAPC**.

To edit a PDUAPC, select Edit.

To define a new PDUAPC in the Bull System Manager configuration database, click the New **PDUAPC** button and initialize the following attributes:

PDUAPC name name of the APC power Distribution Unit

description description

network name bay netname

SNMP port number SNMP port number

SNMP community SNMP community

3.3.3 BSM iPDU (intelligent Power Distribution Unit Management)

The corresponding Bull System Manager Add-on creates monitoring links between Bull System Manager and the intelligent Power Distribution Unit SNMP agent and WEB GUI.

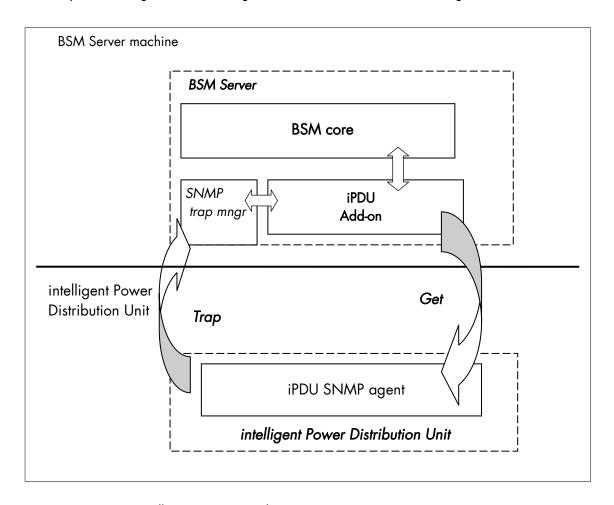

Figure 3-11 intelligent Power Distribution Unit Monitoring Components

3.3.3.1 Default Categories & Services (independent of OS type)

| Targeted OS | Model | Category | Service | Check command |
|-------------|-------|-------------|---------------|-------------------------------|
| Any | IPDU | IPDU | Alerts | No check (SNMP trap receiver) |
| | | | Status | check_ipdu_status |
| | | Power | Consumption | check_ipdu_pwr_consumption |
| | | | Outlets_Conso | check_ipdu_outlet_conso |
| | | Environment | Temperature | check_ipdu_temperature |

Table 3-14. Default intelligent Power Distribution Unit monitoring services

3.3.3.2 Optional Services (independent of OS type)

| Targeted OS | Model | Category | Service | Check command |
|-------------|-------|-------------|-----------------|------------------------|
| Any | IPDU | Power | Voltage | check_ipdu_voltage) |
| | | | Outlets_Voltage | check_ipdu_outlet_volt |
| | | Environment | Humidity | check_ipdu_humidity |

Table 3-15. Optional intelligent Power Distribution Unit monitoring services

Note

These categories are based on the intelligent Power Distribution Unit SNMP agent. The SNMP interface is a requirement for the default and optional intelligent Power Distribution Unit monitoring services.

3.3.3.3 IPDU Category

Alerts For IPDU hosts. When an alert is sent from the intelligent PDU SNMP agent, it

is processed by the Bull System Manager Server.

Status For IPDU hosts managed via its SNMP agent. This service checks the

intelligent PDU status reported by the SNMP agent.

Notes • The hdpduv0_91_Linux.mib file is integrated in the Bull System Manager application.

 Do not forget to configure the intelligent PDU SNMP agent to send SNMP traps to the Bull System Manager Server by adding the Bull System Manager Server host address to the agent's SNMP managers list.

3.3.3.4 Power Category

Consumption For intelligent PDU hosts managed via SNMP agents. This service

checks the global power consumption (in Watts) for each intelligent

PDU.

Outlets_Conso For intelligent PDU hosts managed via SNMP agents. This service

checks each intelligent PDU outlet consumption (in Watts) reported by

the SNMP agent.

Optional services

Voltage For intelligent PDU hosts managed via SNMP agents. This service

checks the input and output voltage and frequency for each intelligent

PDU.

Outlets_Voltage For intelligent PDU hosts managed via SNMP agents. This service

checks the output voltage of each outlet of an intelligent PDU reported

by the SNMP agent.

3.3.3.5 Environment Category

Temperature For intelligent PDU hosts managed via SNMP agents. This service

checks the temperature for each intelligent PDU.

Optional services

Humidity For intelligent PDU hosts managed via SNMP agents. This service

checks the humidity for each intelligent PDU.

3.3.3.6 Performance Indicators

Performance indicators are defined for the monitoring services of intelligent Power Distribution Unit listed below. These obtain values from the corresponding monitoring services. Performance indicators are collected by analyzing performance data provided by Nagios plug-in with PNP4Nagios.

PNP4Nagios is delivered in as BSM Server Extension and its installation is optional.

| Indicators | Corresponding Service |
|--|-------------------------|
| watts, Wh | Power.Consumption |
| Outlet <n>_watts</n> | Power.Outlets_Conso |
| Outlet <n>_Wh</n> | |
| inputVolt, inputFrequency | Power.Voltage |
| outputVolt, outputFrequency | |
| Outlet <n>_volt, Outlet<n>_frequency</n></n> | Power.Outlets_Voltage |
| Temperature | Environment.Temperature |
| Humidity | Environment.Humidity |

Table 3-16. Performance Indicators applied to the IPDU Host

3.3.3.7 Nagios check commands

check_IPDU (any OS) Nagios command

The Bull System Manager service check command syntax is:

check_IPDU!<action>!<timeout>

Values available for <action> are:

- Status
- Consumption
- OutletsConso
- Outlets Voltage
- Voltage
- Temperature
- Humidity

See the check_ IPDU command in Chapter 4 for parameter details.

For HOSTADDRESS, SNMP community and SNMP port parameters, the Nagios macros \$HOSTADDRESS\$, \$_HOSTSNMP_COMMUNITY\$ and \$_HOSTSNMP_PORT\$ are used.

3.3.3.8 Bull System Manager Configuration

Intelligent PDU configuration for Bull System Manager is available from the configuration GUI by selecting Topology \rightarrow Device hosts \rightarrow IPDU.

To edit an IPDU, select Edit.

To define a new IPDU in the Bull System Manager configuration database, click the **New IPDU** button and initialize the following attributes:

Intelligent Power Distribution Unit name name of the intelligent Power Distribution

Unit

description description

network name IPDU netname

SNMP port number SNMP port number

SNMP community SNMP community

3.4 Virtualization Server Add-ons

The following Add-ons are used for monitoring virtual machines.

3.4.1 Overview

The Bull System Manager Server Virtualization Add-ons deliver an optional management package to manage virtual machines. A virtualization Add-on can provide:

- Supervision features to detect abnormalities and notify the corresponding defined entities.
- Administration features to perform actions on elements.

3.4.1.1 Definitions

Virtualization Add-ons use specific topology elements:

• Native Operating System (Native OS):

The virtualization layer installed on a physical machine that hosts virtual machines. It is represented by a Bull System Manager host with a specific OS (specified by the Addon).

Virtual Machine (VM):

A machine that is hosted by a native OS. It is represented by a Bull System Manager host with a specific model (specified by the Add-on).

Virtual Platform:

The set of virtual machines and native OS deployed on a physical machine.

Virtual Manager:

The interface used to manage the virtual elements.

3.4.1.2 Topology Representation

The elements of a virtual platform are displayed in the Bull System Manager Console views.

To load a specific view, click the icon at the top of the Tree frame to select a view among available views, as shown below:

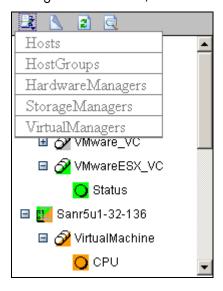

Figure 3-12. BSM Console Views

- Only the native OS and VM hosts are displayed for the **Hosts** view. VM hosts are represented with the specific icon .
- From the Virtual Managers view, the virtual platform is displayed as shown in the diagram below:

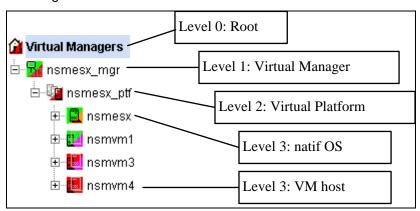

Figure 3-13. Virtual Managers view

Under the root node, the first node is the Virtual Manager that administrates the Virtual Platform. The Virtual Platform contains the native host and the VM hosts.

When you select a node, information about the elements are displayed in the Application Window.

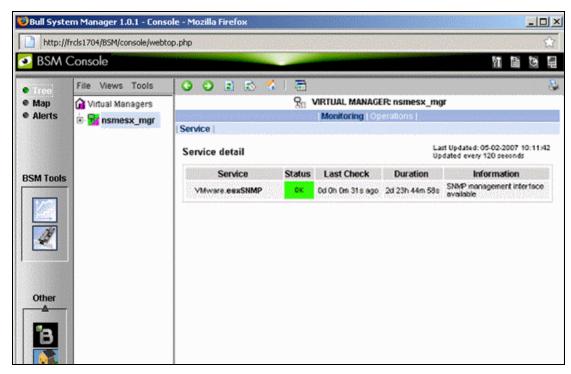

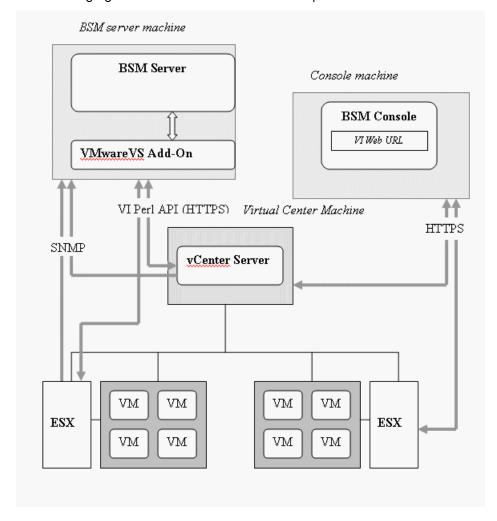

Figure 3-14. Virtual Manager Monitoring Window

3.4.2 BSMVMwareVS for managing VMware vSphere

VMware vSphere allows the management of large pools of virtualized computing infrastructures, including software and hardware. The vSphere includes several components, including the ESX server (ESX and ESXi), a virtualization layer that abstracts processor, memory, storage and networking resources into multiple virtual machines, and the vCenter server that provides a central point of control for managing, monitoring, provisioning, and migrating virtual machines (VM).

The VMwareVS Add-on retrieves VM and ESX monitoring information from vCenter or ESX via the VI Perl toolkit API and allows the Web Virtual Interface to be launched from the Bull System Manager Console. It can also process trap information sent by vCenter (VirtualCenter) if the vCenter alarms are configured to send this, or by ESX if it is configured to send traps to the Bull System Manager server. For detailed information about these procedures, see the VMware Infrastructure documentations available at http://www.vmware.com/support/pubs/vi_pubs.html (for ESX3) or at http://www.vmware.com/support/pubs/vs_pubs.html. (for ESX4)

The following figure shows links between each component:

The VMwareVS addon replaces VMwareESX and VMwareVC Add-ons.

Migration from VMwareVC to VMwareVS can be done automatically with special installation.

Migration from VMwareESX to VMwareVS also requires manual operation. For details, see section 3.4.2.7 Migrating VMwareVC or VMwareESX to VMwareVS on page 70.

The VM and ESX elements can be monitored from an ESX server or from a vCenter application. When elements are monitored from an ESX server, they are grouped in a single BSM platform (ESX Virtual Platform).

When elements are monitored from a vCenter, they are grouped in several platforms (VMware Datacenter Platform), depending of the VMware Datacenters configuration. Each ESX server is represented by a BSM host with the OS: **ESX**.

Each VM is represented by a BSM host with the model: VMware.

3.4.2.1 Configuring ESX Virtual Platform

To configure an ESX Virtual Platform, click the **VMware ESX** link in the Virtualization part of the Topology domain. The list of all configured platforms appears, as shown in the diagram below:

ESX Virtualization Platforms

| | platform | server | description | host name | virtual name | network name | os |
|------------|--------------|---|------------------------------------|------------|--------------|--------------|-------|
| | nomeov wif | nsmesx esx | VMware ESX Virtualization platform | sles10_esx | sles10 | 172.31.50.61 | other |
| nsmesx ptf | lisniesx esx | VIVIVALE ESA VIII GAILZALION PIALTONIII | rh54 esx | rh54 | 172.31.50.60 | other | |

Figure 3-15. ESX Virtual Platforms page

It is possible:

- To create a new ESX Virtual Platform using the New button
- To edit or delete a platform using the <platform> link
- To edit an ESX host using the <server> link.
- To edit a virtual machine using the <hostname> link.

When you click the **New** button, the following display appears with all the resource properties:

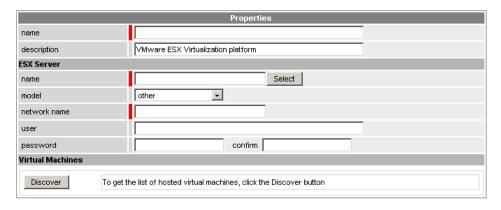

Figure 3-16. ESX Platform Properties

Besides the characteristics (name and description) of the main object, the properties of an ESX virtual platform are divided into two sections:

- ESX Server Host: used to define the physical machine and the native OS.
- Virtual Machines: used to describe the VMware ESX platform virtual machine.

ESX Server Host Properties

| name | ESX host short name. This name is displayed in the Bull System Manager Console views. Click Select to choose a defined host from the BSM host list. |
|--------------|--|
| model | Host model (see the <i>Bull System Manager Administrator's Guide</i> for values). |
| network name | ESX host network name (hostname or IP address). |
| user | username used to connect ESX via the VI Perl Toolkit |
| password | User password |

Virtual Machines Properties

| Virtual Machines | List of the VMs established by selecting the VMs obtained by |
|------------------|--|
| | requests to the ESX server via the Perl API. The request is performed |
| | by clicking the Discover button (or Re-discover if in edition mode). |
| | See the complete description of the procedure below. |

If VMs are linked to the ESX server, this could not be supervised later with the vCenter server.

Virtual Machines Discovered

Note

Following the use of the Discover tool, the results are displayed as a table composed of three parts:

- The left column allows you to select the VMs to be associated to the platform.
- The center part displays Virtual Machine Configuration as defined on the VMware ESX server.

 The right part allows you to edit the main properties (name, network name and OS) of the corresponding BSM host. The host can be edited only if the corresponding VM is selected. You can select a host, already defined, by clicking the Select button or you can create a host by completing the corresponding fields.

Note When you select a host, already defined, you cannot change its network name and OS. However, the Select contains a Default Option corresponding to the VM name that can be edited. If the VM name contains space(s), they are replaced by underscore(s) in the host label.

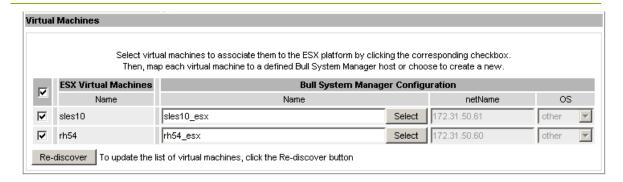

Figure 3-17. ESX Virtual Machines pane

Virtual Machines Re-Discovered

The use of the Re-discover tool is required to check that the current BSM configuration still matches the VMware ESX configuration in order to:

- Add virtual machine not yet registered in the VMware ESX Virtualization Platform
- Remove virtual machine no longer defined in the VMware ESX configuration.

During the Re-discover step, if the current configuration is not compatible with VMware ESX configuration, the invalid VMs are displayed in red and the VMs not referenced in the current BSM configuration are displayed in green.

VMs no longer defined in VMware ESX are automatically unchecked and will be removed from the list shown. New VMs must be explicitly checked to be included.

Note How to Add, Delete or Modify Virtual Machine is detailed in § 3.4.2.2 *Editing Virtual Machine Set-up*, on page 56.

When the configuration has been edited:

- Click OK to validate your changes.
- Or click **Cancel** to return to Virtual Platforms pages without any change.
- Or click **Delete** to remove the Virtual Platform and maintain the hosts corresponding to the VMs and the VMware ESX server.
- Or click DeleteAll to remove the Virtual Platform and the hosts corresponding to the VMs and the VMwareESX server.

Note Host Topology modification require confirmation: a page listing all the modifications to be applied to the Topology configuration is displayed, as shown in the following figure.

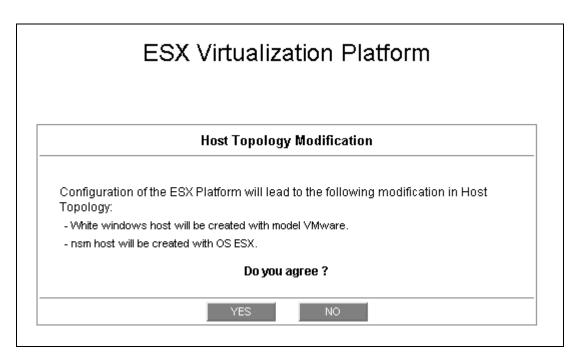

Figure 3-18. Host Topology modification confirmation screen

If you do not agree, click **NO** to return to the platform configuration window, otherwise click **YES** to create the virtual platform.

Related ESX Virtualization platform Objects

When an ESX Virtualization platform is defined, related objects are automatically generated to configure the type of Supervision linked to this type of server. The table, below, describes the objects generated during the creation of the platform.

| Туре | Description |
|-------------------------|--|
| host VMware | As defined in the Virtual Machine configuration part of the edition page. |
| host ESX | Host corresponding to the virtualization layer, as defined in the ESX server Host configuration part. |
| hostgroup | hostgroup representing the physical platform, named <platformname>.</platformname> |
| manager | Virtualization manager representing the management interface, named < platformName>_mgr. |
| categories and services | The VMwareESX category and related services are instantiated for the ESX host. |
| | The Virtual Machine category and related services are instantiated for each VMware host. |
| | The VMware category and related services are instantiated for the ESX and VM hosts. |
| periodic task | The CollectDataVMware task is activated with a period of 4 minutes (go to LocalSetting domain and click the Periodic Tasks menu to view its properties). |

3.4.2.2 Editing Virtual Machine Set-up

A virtual machine is represented by a host linked to the VMware ESX Virtualization platform. It has properties linked to the platform, and the properties of a host object.

Adding, removing or modifying properties linked to the platform must be done from the VMware Virtualization platform editing Window.

Modification of host properties must be done from the Host editing Window.

Adding a virtual machine to a platform

Adding a virtual machine is done by checking the corresponding line in Virtual Machines part of the platform editing window, and setting the host characteristics in the BSM Configuration table zone (by filling in the corresponding fields or by selecting an already defined host).

Note

When you edit a Virtualization platform, only the Virtual Machines defined for the Bull System Manager platform are displayed. To add a virtual machine, you must perform a Rediscovery to obtain the list of the machines defined for the Virtualization Server.

Removing a virtual machine from a platform

Removing a virtual machine is performed by unchecking the corresponding line in the Virtual Machines section for the platform.

Note

The corresponding host remains in the Bull System Manager definition with model set to **other**. To delete it, click the **Other Hosts** link to get the list of all Other Hosts configured, edit the corresponding host and click the **Delete** button.

Modifying a virtual machine defined in a platform

To modify the name of the **BSM** host corresponding to a virtual machine, enter the new name in the corresponding field or select it in the list of hosts, already defined in Bull System Manager by clicking the **Select** button.

To modify other characteristics, for example netName or OS, the Host edition form must be used.

Note

To get the Host edition form corresponding to the virtual machine, click the **Hostname** link displayed in the global platforms page.

Deleting all virtual machines and corresponding hosts.

To delete all virtual machines and corresponding hosts, use the **DeleteAll** button of the Virtualization Platform Edition form. Keep in mind the fact that the virtualization server and the platform will also be deleted from the Bull System Manager configuration

3.4.2.3 Configuring vCenter managed Datacenter Platforms

To configure a set of Datacenter Platforms managed by vCenter, click the **VMware vCenter** link in the Virtualization part of the Topology domain. The list of all platforms configured appears, as in the following example:

VMware DataCenter Platforms

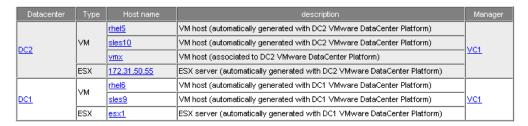

Figure 3-19. VMware DataCenter Platforms page

It is possible:

- To create a new set of platforms managed by vCenter by using the New button
- To edit or delete a platform using the <Datacenter> link
- To edit or delete a vCenter using the <Manager> link
- To edit a virtual machine or ESX using the <hostname> link.

When you click the **New** button, the following display appears for all the resource properties:

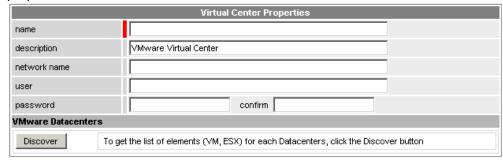

Figure 3-20. Virtual Center Properties

The first part of the form is used to define the characteristics of the VirtualCenter server.

The second part is used to describe the datacenters and the elements to be managed by the Virtual Center.

Virtual Center Properties

| name | Virtual Center short name. |
|--------------|--|
| | This name is used to define the Virtualization Manager |
| network name | Virtual Center network name (hostname or IP address). |
| user | username used to connect the VirtualCenter via the VI Perl Toolkit |
| password | User password |

Datacenters Properties

Datacenters

List of the datacenters and their elements established by selecting the datacenters obtained by requests to the VirtualCenter server. The request is performed by clicking the **Discover** button (or **Re-discover** if in edition mode).

See below the complete description of the procedure.

DatataCenters Discovery

The result of the discovery is displayed as set of tables (one for each datacenter), composed of three parts:

- The left column allows you to select the VMs or the ESX to be associated with the platform.
- The center part displays element Configuration as defined on the VMware Virtual Center server.
- The right part allows you to edit the main properties (name, network name and OS) of the corresponding BSM host. The host can only be edited if the corresponding element is selected. You can select a host already defined by clicking the Select button or you can create a host by completing the corresponding fields.

Notes When you select a host, previously defined, you cannot change its network name and OS. However, the Select contains a Default Option corresponding to the element name that can be edited. If the name contains space(s), they are replaced by underscore(s) in the host label. The OS of ESX server cannot be changed (set to ESX).

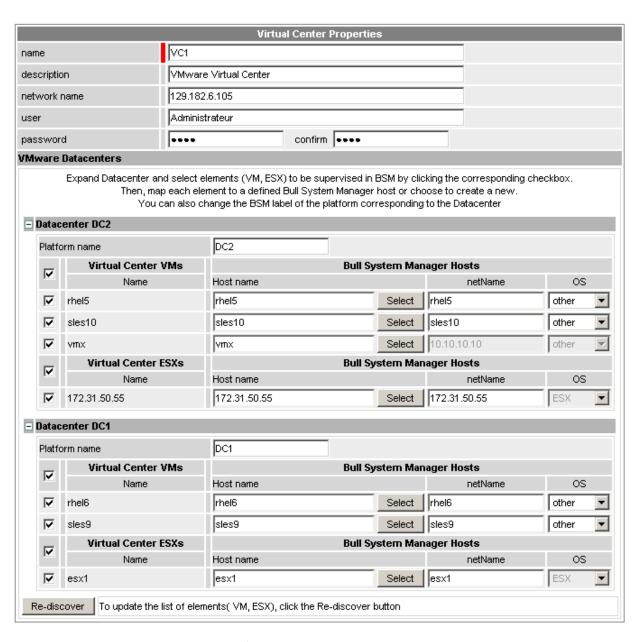

Figure 3-21. Datacenters panel

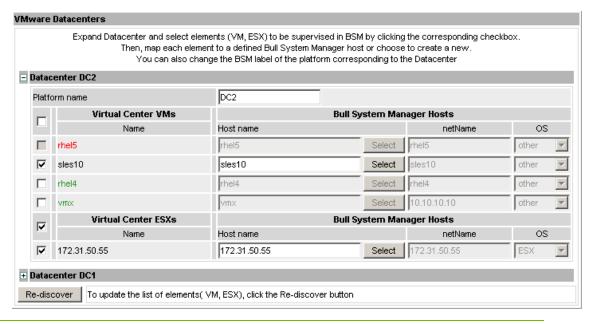

Datacenters Re-Discovery

Re-Discovery is required to check that the current BSM configuration still matches the Virtual Center configuration in order to:

- Add an element not yet registered in the Datacenter Platform
- Remove an element no longer defined in the Virtual Center configuration.

During the Re-discovery step, if the current configuration is not compatible with Virtual Center configuration, the invalid elements are displayed in red and the elements not referenced in the current BSM configuration are displayed in green.

Elements no longer defined in Virtual Center are automatically unchecked and will be removed from the platform when the form is validated. New elements must be explicitly checked to be added to the platform to be linked to the platform when the form is validated.

Note How to Add, Delete or Modify Datacenter elements is detailed in *Configuring Datacenter Element*, on page 62.

When the Datacenter elements have been edited:

- Click **OK** to validate your edition
- Or click Cancel to return to Datacenter Platform pages without making any changes
- Or click Delete to remove the VirtualCenter and Datacenter platforms managed and maintain the hosts corresponding to the VMs and the ESX server
- Or click DeleteAll to remove the VirtualCenter, Datacenter platforms managed and the hosts corresponding to the VMs and the VMwareESX server.

Note Any changes made are shown in the **Topology modification** Window and requires confirmation: a page listing all modifications to be applied to the Topology configuration is displayed, as shown in the following figure.

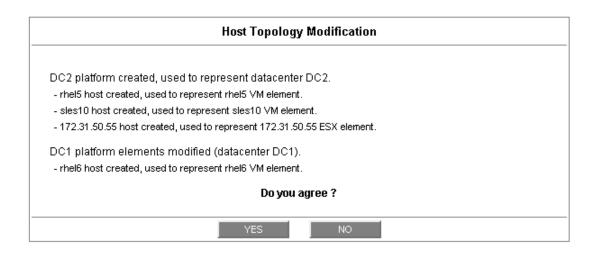

Figure 3-22. Topology modification confirmation

If you do not agree, click **NO** to return to the previous screen, otherwise click **YES** to create the datacenters.

Related Datacenters platform Objects

When a Datacenter platform is defined, related objects are automatically generated or updated to configure the Supervision level linked to this type of server. The following table describes the objects generated when the platform is created.

| Туре | Description |
|-------------------------|--|
| host VM | As defined in the Virtual Machine configuration section of the edition page. |
| host ESX | Hosts corresponding to the virtualization layer, as defined in the ESX server Host configuration part. |
| hostgroup VM | hostgroup representing the datacenter for VM part, named <platformname>.</platformname> |
| hostgroup ESX | hostgroup representing the datacenter for ESX part, named <platformname>_ESX.</platformname> |
| manager | Virtualization manager representing the management interface, named < platformName>_mgr. |
| categories and services | The VMwareESX category and related services are instantiated for the ESX host. |
| | The Virtual Machine category and related services are instantiated for each VMware host. |
| | The VMware category and related services are instantiated for the ESX and VM hosts. |
| periodic task | The CollectDataVMware task is activated with a period of 4 minutes (go to LocalSetting domain and click the Periodic Tasks menu to view its properties). |

Note No link between an ESX and a VM machine is configured, due to the vMotion functionality.

3.4.2.4 Configuring Datacenter Elements

A VM or an ESX is represented by a host linked to the Datacenter Virtualization platform. It has properties linked to the platform, and also properties of a host object.

Adding, removing or modifying properties linked to the platform must be done using the VMware Datacenter platform Window.

Modification of host properties must be done using the Host Window.

Add an element (VM or ESX) to a datacenter

An element is added by checking the corresponding line in the platform Window, and by setting the host characteristics in the BSM Configuration table zone (fill in the corresponding fields or select a host that is already defined).

Note

When you edit a Datacenter platform, only the elements defined as part of the Bull System Manager platform are displayed. To add an element, you must perform a Re-discovery to get the list of all elements defined in the datacenter.

Remove an element from a datacenter

Removing an element is performed by unchecking the corresponding line in the platform Window.

Notes The corresponding host remains in the Bull System Manager definition with the model set to other. To delete it, click the Other Hosts link to get the list of all the Other Hosts configured, edit the corresponding host and click the Delete button.

If all the elements of a platform are deleted, the platform itself is deleted.

Modify an element defined in a datacenter

To modify the name of a BSM host corresponding to an element, enter the new name in the corresponding field or select it in the list of hosts already defined in Bull System Manager by clicking the **Select** button.

To modify other characteristics, such as netName or OS, the Host edition form must be used.

Note

To view the Host Window for the definition of elements corresponding to the virtual machine, click the **Hostname** link displayed in the global platforms page.

Delete all elements and corresponding hosts.

Use the **DeleteAll** button to delete all elements managed by a Virtual Center and corresponding hosts.

3.4.2.5 Supervising Virtualization

As specified above, categories and services are instantiated for host defined in the Virtualization Platform. You can disable virtualization supervision by editing the hostgroup or manager properties, or by editing each service (refer to the *Bull System Manager Administration Guide* for details).

Monitoring Services

Monitoring services defined for the native OS are associated with the **VMwareESX** category.

Services Applied to the ESX hosts (category VMwareESX)

| Service | Description | Check_command |
|---------|--------------------------------|----------------------|
| Status | Checks ESX server status | check_esx_vsphere |
| Memory | Checks ESX memory availability | check_esxmem_vsphere |
| CPU | Checks ESX CPU availability | check_esxcpu_vsphere |
| Network | Checks ESX network traffic | check_esxnet_vsphere |
| Disk | Checks ESX disk traffic | check_esxio_vsphere |

Note

To check metrics not defined in delivered services, you can clone the Template service that is based on the <code>check_esxstat_vsphere</code> command.

Services Applied to the VM Host (category VirtualMachine)

| Service | Description | Check_command |
|---------|-------------------------------|---------------------|
| Status | Checks VM status | check_vm_vsphere |
| Memory | Checks VM memory availability | check_vmmem_vsphere |
| CPU | Checks VM CPU availability | check_vmcpu_vsphere |
| Network | Checks VM network traffic | check_vmnet_vsphere |
| Disk | Checks VM disk traffic | check_vmio_vsphere |

Note

To check metrics not defined in delivered services, you can clone the Template service that is based on the <code>check_vmstat_vsphere</code> command.

Services Applied to the ESX and VM hosts (category VMware)

| Service | Description | Check_command |
|---------|--|---------------------------|
| Alerts | Processes alerts received from the ESX or vCenter SNMP agent | none (SNMP Trap receiver) |

At installation time, categories are defined with a hostList set to **none** and services are defined with an hostList set to '*'.

When editing the Virtualization Platform, the category's hostList is updated for the ESX and/or VM hosts defined in the platform, leading to the activation of the corresponding services. Theses services can be displayed and edited from the Services page in the Supervision domain

3.4.2.6 Nagios Check Commands

check_esx_vsphere

The configurable Bull System Manager service check command syntax is:

check_esx_vsphere

No parameter must be set.

check_esxstat_vsphere

The configurable Bull System Manager service check command syntax is:

check_esxstat_vsphere>!<stat>!<wThres>!<cThres>!<indic>

See the **check_vsphere.pl** command examples in Section 4.3.1 for parameter details.

check_esxcpu_vsphere

The configurable Bull System Manager service check command syntax is:

check_esxcpu_vsphere>!<stat>!<wThres>!<cThres>

This command checks the cpu.usage.average metric.

See the **check_vsphere.pl** command examples in Section 4.3.1 for parameter details.

check esxmem vsphere

The configurable Bull System Manager service check command syntax is:

check_esxmem_vsphere>!<stat>!<wThres>!<cThres>

This command checks the mem.usage.average metric and collects data for additional metrics (see the command to get the list)

See the **check_vsphere.pl** command examples in Section 4.3.1 for parameter details.

check_esxnet_vsphere

The configurable Bull System Manager service check command syntax is:

check_esxnet_vsphere>!<stat>!<wThres>!<cThres>

This command checks the net.usage.average metric and collects data for additional metrics (see the command to get the list)

Note

The **net.usage.average** unit is Kb/s. By default, the threshold are set to 80400 and 102400 in the service definition. Depending on your network capacity, you can change these values.

See the **check_vsphere.pl** command examples in Section 4.3.1 for parameter details.

check_esxio_vsphere

The configurable Bull System Manager service check command syntax is:

check_esxio_vsphere>!<stat>!<wThres>!<cThres>

This command checks the disk.usage.average metric and collects data for additional metrics (see the command to get the list)

Note

The **disk.usage.average** unit is Kb/s. By default, the thresholds are set to 80400 and 102400 in the service definition. Depending on your disk capacity, you can change these values.

See the **check_vsphere.pl** command examples in Section 4.3.1 for parameter details.

check_vm_vsphere

The configurable Bull System Manager service check command syntax is:

```
check_vm_vsphere
```

No parameter must be set.

check_vmstat_vsphere

The configurable Bull System Manager service check command syntax is:

```
check_statvm_vsphere>!<stat>!<wThres>!<cThres>!<indic>
```

See the **check_vsphere.pl** command examples in Section 4.3.1 for parameter details.

check_vmcpu_vsphere

The configurable Bull System Manager service check command syntax is:

```
check_vmcpu_vsphere>!<stat>!<wThres>!<cThres>
```

This command checks the cpu.usage.average metric and collects data for additional metrics (see the command to get the list)

See the **check_vsphere.pl** command examples in Section 4.3.1 for parameter details.

check_vmmem_vsphere

The configurable Bull System Manager service check command syntax is:

```
check_vmmem_vsphere>!<stat>!<wThres>!<cThres>
```

This command checks the mem.usage.average metric and collects data for additional metrics (see the command to get the list)

See the **check_vsphere.pl** command examples in Section 4.3.1 for parameter details.

check_vmnet_vsphere

The configurable Bull System Manager service check command syntax is:

```
check_vmnet_vsphere>!<stat>!<wThres>!<cThres>
```

This command checks the net.usage.average metric and collects data for additional metrics (see the command to get the list)

Note

The net.usage.average unit is Kb/s. By default, the thresholds are set to 80400 and 102400 in the service definition. Depending on your network capacity, you can change these values..

See the **check_vsphere.pl** command examples in Section 4.3.1 for parameter details.

check_vmio_vsphere

The configurable Bull System Manager service check command syntax is:

```
check_vmio_vsphere>!<stat>!<wThres>!<cThres>
```

This command checks the disk.usage.average metric and collects data for additional metrics (see the command to get the list)

Note

The disk.usage.average unit is Kb/s. By default, the thresholds are set to 80400 and 102400 in the service definition. Depending on your disk capacity, you can change these values.

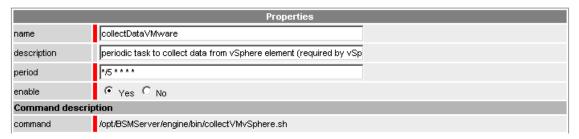

See the **check_vsphere.pl** command examples in *Section 4.3.1* for parameter details.

Collect task

The collect task periodically schedules (each 4 minutes) the script collectVMvSphere.sh that requests all the information from the vCenter or ESX needed by the Nagios plug-in, and stores it in a cache file. This task is enabled when at least one virtualization platform is configured in the BSM.

The script is localized in the <BSM Installation>/engine/bin directory and its execution is logged in the <BSM Installation>/engine/tmp/collectVMvSphere.log file.

To edit task, from LocalSetting domain, click the **Periodic Tasks** menu and edit the **CollectDataVMware** task, the screen below is displayed:

Any modification will be taken into account the next time the task is Saved and Reloaded action.

Reporting Indicators

Reporting indicators are collected by analyzing the performance data provided by Nagios plug-in with PNP4Nagios.

Indicators Applied to the ESX Host

| Indicator | Corresponding Service |
|----------------------|--------------------------|
| CPU_usage (%) | VMwareESX.CPU |
| Memory_usage (%) | |
| Memory_Active (Kb) | |
| Memory_Consumed (Kb) | |
| Memory_Granted (Kb) | VAA FSV AA |
| Memory_Balloon (Kb) | VMwareESX.Memory |
| Memory_Swap_(Kb) | |
| Used,Memory (Kb) | |
| Shared Common (Kb) | |

| Disk_usage (Mb/s) | VMwareESX.Disk | |
|-----------------------------------|-------------------|--|
| Disk_Read_Rate (Mb/s) | | |
| Disk_Write_Rate (Mb/s) | | |
| Disk_Commands_Issued (cmd/s) | | |
| Disk_Read_Requests (cmd/s) | | |
| Disk _Write_Requests (cmd/s) | | |
| Network_usage (Kb/s) | | |
| Network_Data_Transmit_Rate (Kb/s) | VMwareESX.Network | |
| Network_Data_Received_Rate (Kb/s) | | |

Indicators Applied to the VM Host

| Indicator | Corresponding Service |
|----------------------|-----------------------|
| CPU_usage (%) | |
| CPU_Used (ms) | |
| CPU_Ready (ms) | VirtualMachine.CPU |
| CPU_Wait (ms) | Viribal/Machine.CFO |
| CPU_Idle (ms) | |
| CPU_System (ms) | |
| Memory_usage (%) | |
| Memory_Active (Kb) | |
| Memory_Consumed (Kb) | VirtualMachine.Memory |
| Memory_Granted (Kb) | |
| Memory_Balloon (Kb) | |

| Indicator | Corresponding Service |
|-----------------------------------|------------------------|
| Disk_usage (Mb/s) | |
| Disk_Read_Rate (Mb/s) | |
| Disk_Write_Rate (Mb/s) | VirtualMachine Disk |
| Disk_Commands_Issued (cmd/s) | Virtual/Machine.Disk |
| Disk_Read_Requests (cmd/s) | |
| Disk _Write_Requests (cmd/s) | |
| Network_usage (Kb/s) | |
| Network_Data_Transmit_Rate (Kb/s) | VirtualMachine.Network |
| Network_Data_Received_Rate (Kb/s) | |

Note PNP4Nagios is delivered in as BSM Server Extension and its installation is optional.

Bull System Manager Console

VMware Operation

From the Virtual Manager or from any element of the Virtual Platform, you can launch the **Virtual Infrastructure Web Interface** by selecting the following cascading menu:

Operation -> Application -> VMware Virtual Infrastructure Web Access

VMware Monitoring

From the platform or host elements, you can access monitoring information.

From the hosts element, you can display information related to the associated service by selecting **Monitoring** menus.

From the platform element, you can display monitoring information related to all elements by selecting **Monitoring** menus. For instance, you can view all services of the hosts in the platform, as shown in the following figure:

Click status links to display the selected hosts and services

Service details

Last Updated: 25-11-2010 14:23:11 Updated every 120 seconds

| Host | Service | Status | Last Check | Duration | Information |

VMware Reporting

From host elements, you can access reporting information by selecting **PNP Indicators Trends** from the **Reporting** menu.

From the host element, you can display indicators related to this host as shown in the following figure:

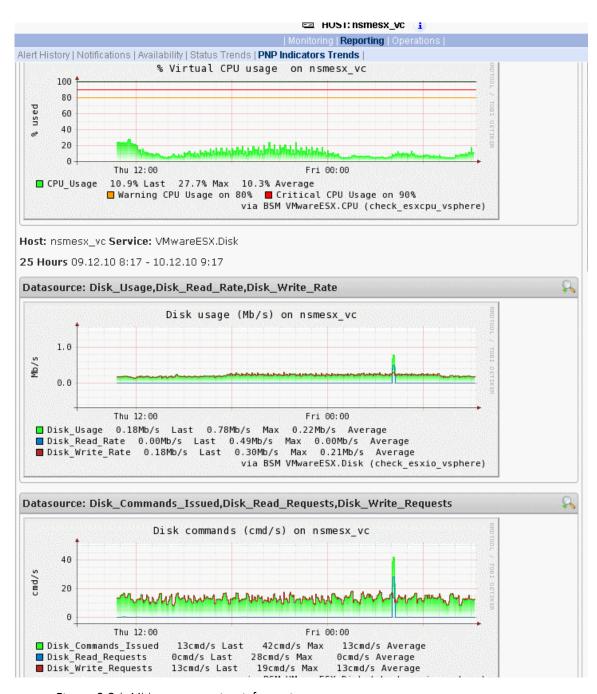

Figure 3-24. VMware reporting information

3.4.2.7 Migrating VMwareVC or VMwareESX to VMwareVS

Linux Platform installation

The VMwareVS and VMwareVC or VMwareESX Linux package contains similar files. Thus, it is not possible to perform standard installation of the VMwareVS package when the VMwareVC or VMwareESX package is installed. You must use rpm command with --force and --nodeps options:

After installing the VMwareVS package, you can remove the VMwareVC or VMwareESX package. All structures must have been preserved by the migration process.

To upgrade a **BSMVMwareESX** or **VMwareVC** Add-on to **VMwareVS**, perform the following step:

Install the VMwareVS Add-on

```
rpm -i BSMVMwareVS-1.4-1.Bull.noarch.rpm --force -nodeps
```

De-install VMwareESX or VMwareVC Add-ons

```
rpm -e BSMVMwareVC
```

Windows installation

On Windows platforms, conflicts between Add-ons may occur following the installation of VMwareVS when VMwareVC or VMwareESX is already installed, however uninstalling VMwareVC or VMwareESX will remove files of VMwareVS addon. Thus, after uninstalling the VMwareVC or VMwareESX Add-on, you must reinstall the VMwareVS package.

To upgrade a BSMVMwareESX or VMwareVC Add-on to VMwareVS, perform the following steps:

- Install VMwareVS Add-on
- De-install VMwareESX or VMwareVC Add-on
- Re-install VMwareVS Add-on

Migrating VMwareVC to VMwareVS

The installation of the **VMwareVS** package keeps the topological configuration of **VMwareVC** and automatically performs the following actions:

- Remove categories and services depending from the VMwareVC Add-on
- Update categories and services depending of the VMwareVS Add-on
- Updates the collect task

Migrating VMwareESX to VMwareVS

The installation of the **VMwareVS** package keeps the topological configuration of VMwareESX and automatically performs the following actions:

• Remove categories and services depending from the VMwareVC addon

Due to interface evolution between ESX and the addon, you must complete the configuration by setting complementary information for the ESX server:

- User and password must be filled in
- A re-discovery must be performed to check the user/password and to get internal information related to the ESX server.

3.4.3 EscalaLPAR Add-on

Dynamic logical partitioning (LPAR) is a system architecture delivered on Escala systems that is used to divide a single server into several completely independent virtual servers or logical partitions.

The HMC (Hardware Management Console) is a special-purpose system that provides management tools for controlling one or more Escala Privilege Line servers and associated logical partitions (LPARs). Management can be performed either through the HMC GUI or through the command-line interface (using a SSH connection to the HMC).

For system not managed by an HMC, Integrated Virtualization Manager (IVM) provides a local management of the partitions. IVM, which is part of the Virtual I/O Server, is a special purpose partition that provides virtual I/O resources for the other partitions.

The **EscalaLPAR** Add-on provides functional links to supervise the logical partitions by requesting the HMC system or the IVM component.

Escala Supervision with HMC or IVM requires the setting of a non-prompt SSH connection between the Bull System Manager Server and the manager. Private key for the Bull System Manager server is automatically generated at the installation of Bull System Manager server under <BSM installation directory>/engine/etc/ssh (see Appendix F for detailed information). To allow a non-prompt connection between the BSM Server and the HMC, the public key must be installed on the HMC or IVM hosting server. Refer to the HMC or IVM documentation to see how to install the key.

The following figure shows the link between each component, for systems managed with HMC:

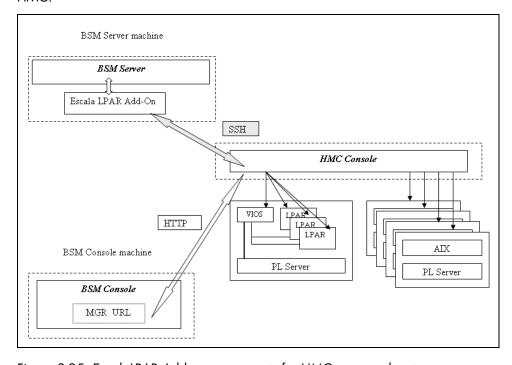

Figure 3-25. EscalaLPAR Add-on components for HMC managed systems

The following figure shows the link between each component, for system managed with IVM:

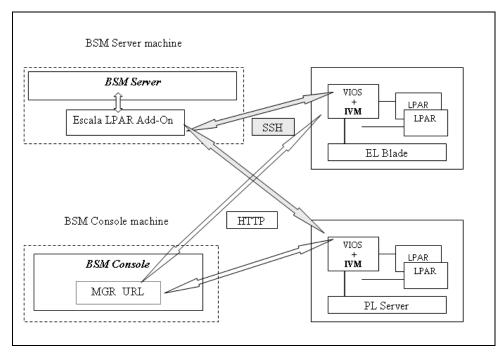

Figure 3-26. EscalaLPAR Add-on components for IVM managed systems

3.4.3.1 Configuring Bull System Manager

To configure the monitoring elements for the EscalaLPAR Add-on, you have to define an Escala Platform from the Bull System Manager Configuration GUI.

The definition of an Escala Platform is done in two steps:

- initialization of the Escala Server
- definition of the partitioning (LPARs)

HMC managed Escala Server

The initialization of an HMC managed system is done through the **PL Server** link under Hosts Definition/Escala hosts menu of the **Topology** domain.

IVM managed Escala Server

The initialization of an IVM managed Escala Server requires that this server contains a VIOS partition. This is done through the **EL Blade** or **PL Server** links under the Hosts Definition/Escala hosts menu of the **Topology** domain.

Non managed Escala Server

The initialization of a non managed Escala Server is done through the **PL Server** links under the Hosts Definition/Escala hosts menu of the **Topology** domain.

Escala Server Partitioning

The definition of the partitioning is done through the LPARs links

To get detailed information about How to Define Escala Hosts, see the *Bull System Manager Administrator's Guide*.

3.4.3.2 Virtualization Supervision

Services and associated performance indicators are instantiated for each host defined in the Escala LPAR platform.

You can disable virtualization supervision by editing the hostgroup or manager properties, or by editing each service (refer to the *Bull System Manager Administration Guide* for details).

Monitoring Services applied to the server managed by IVM

Monitoring services defined for the server managed by IVM (hosting the VIOS partition) are associated with the VIOS and VIOSActivity categories.

| Service | Description | Check_command |
|-----------------------|---|----------------------|
| VIOS.Status | Checks the status of the Virtual I/O server | check_vios_status |
| VIOS.UsedPool | Checks the utilization of the processing pool on server | check_vios_pool |
| VIOSActivity.UsedNPIV | Checks the utilization of NPIV on Virtual I/O Server | check_vios_used_npiv |
| VIOSActivity.UsedSEA | Checks the utilization of SEA on Virtual I/O Server | check_vios_used_sea |

Monitoring Services applied to the server managed by HMC

Monitoring services defined for the PL server managed by an HMC are associated with the **ProcessorPool** category.

| Service | Description | Check_command |
|-------------|--|----------------------------|
| DefaultPool | Checks the utilization of the Default Processor Pool | ceck_cec_used_pool |
| SharedPool | Checks the utilization of a processor pool (a) | check_used_configured_pool |

⁽a) The number and the name of the SharedPool services is deduced from the user defined shared pool.

Monitoring Services Applied to the LPAR Host

Monitoring services defined for LPAR hosts are associated with the **VirtualMachine** category.

| Service | Description | Check_command |
|---------|---|---------------------|
| Status | Checks LPAR status | check lpar_status |
| UsedCPU | Checks the utilization of the entitled CPU by the partition | check_lpar_used_cpu |

Monitoring services related to Escala Platform elements are automatically created when the platform details are edited. Theses services can be displayed and edited from the **Services** page in the Supervision domain, but only the attributes related to monitoring or notification can be edited.

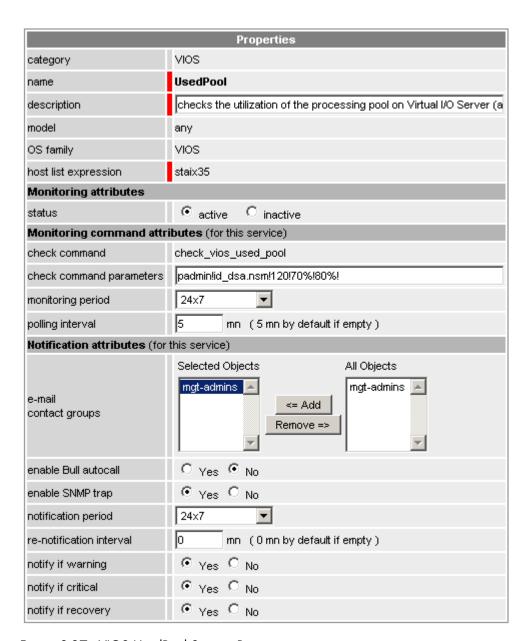

Figure 3-27. VIOS. UsedPool Service Properties pane

Note

During Platform definition, all services are defined and activated for the server and for each LPAR. To deactivate the monitoring of a service, edit it and set its **status** (Monitoring attributes part) to **inactive**.

Reporting indicators

Reporting indicators are collected by analyzing performance data provided by Nagios plug-in with PNP4Nagios.

Indicators applied to the server managed by HMC

| Indicator | Corresponding Service | |
|-------------|--------------------------------------|--|
| PoolUsage | ProcessorPool. <poolname></poolname> | |
| PoolSize | ProcessorPool. <poolname></poolname> | |
| <pre></pre> | ProcessorPool. <poolname></poolname> | |

Indicators applied to the VIOs host

| Indicator | Corresponding Service | |
|------------------------------|------------------------|--|
| CPU_usage | VirtualMachine.UsedCPU | |
| NPIV Usage | VIOSActivity.UsedNPIV | |
| NPIV In for <ident></ident> | VIOSActivity.UsedNPIV | |
| NPIV Out for <ident></ident> | VIOSActivity.UsedNPIV | |
| SEA Usage | VIOSActivity.UsedSEA | |
| SEA In for <ident></ident> | VIOSActivity.UsedSEA | |
| SEA Out for <ident></ident> | VIOSActivity.UsedSEA | |

Indicators applied to the LPAR host

| Indicator | Corresponding Service | |
|-----------|------------------------|--|
| CPU_usage | VirtualMachine.UsedCPU | |

3.4.3.3 Nagios Check Commands

check_vios_status

The configurable BSM service check command syntax is:

check_vios_status!<ssh_user>!<identity_file>

See the **check_NSM_escala_lpar** command examples in *Section 4.3.2* for parameter details.

check_vios_used_pool

The configurable BSM service check command syntax is:

check_vios_used_pool!<ssh_user>!<identity_file>!<sample_time>!<warning_th
reshold>!<critical_threshold>

See the **check_NSM_escala_lpar** command examples in *Section 4.3.2* for parameter details.

check_vios_used_sea

The configurable BSM service check command syntax is:

check_vios_used_sea!<sample_time>!<warning_threshold>!<critical_threshold
</pre>

The ssh user and identity file properties are now defined contextually at the host level and

See the **check_NSM_escala_lpar** command examples in *Section 4.3.2* for parameter details.

Note

check_vios_used_npiv

The configurable BSM service check command syntax is:

are automatically set for the check command by Nagios.

check_vios_used_npiv!<sample_time>!<warning_threshold>!<critical_threshold>
d>

See the **check_NSM_escala_lpar** command examples in *Section 4.3.2* for parameter details.

Note

The ssh user and identity file properties are now defined contextually at the host level and are automatically set for the check command by Nagios.

check cec used pool

The configurable BSM service check command syntax is:

check_cec_used_pool!<hmc_netname>!<ssh_user>!<identity_file>!<cec_name>!<
sample_time>!<warning_threshold>!<critical_threshold>

See the **check_NSM_escala_lpar** command examples in *Section 4.3.2* for parameter details.

check_used_configured_pool

The configurable BSM service check command syntax is:

check_used_configured_pool!<sharedPoolName>!<sample_time>!<warning_thresh
old>!<critical_threshold>

See the **check_NSM_escala_lpar** command examples in *Section 4.3.2* for parameter details.

check_lpar_status

The configurable BSM service check command syntax is:

check_lpar_status!<mgr_type>!<mgr_netName>!<ssh_user>!<identity_file>!<sy
stem_name>!<lpar_name>

See the **check_NSM_escala_lpar** command examples in *Section 4.3.2* for parameter details.

check_lpar_used_cpu

The configurable BSM service check command syntax is:

check_vios_lpar_used_cpu!<mgr_type>!<mgr_netName>!<ssh_user>!<identity_file>!
<system_name>!<lpar_name>!<sample_time>!<warning_threshold>!<critical_threshold>

See the **check_NSM_escala_lpar** command examples in *Section 4.3.2* for parameter details.

3.4.4 Bull System Manager Console

From the Virtual Manager or from any element of the Escala Platform:

• If the system is managed by HMC, you can launch the **HMC Web Interface** by selecting the cascading menu below:

 $Operation \rightarrow Virtualization \rightarrow HMC$

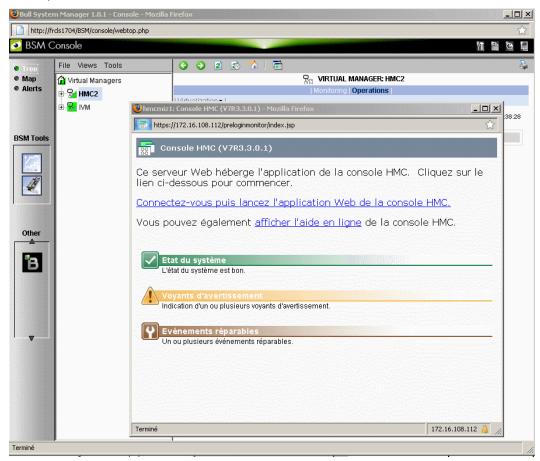

Figure 3-28. HMC activation from Bull System Manager Console

• If the system is managed by IVM, you can launch the IVM Web Interface by selecting the cascading menu below:

Operation → Virtualization → IVM

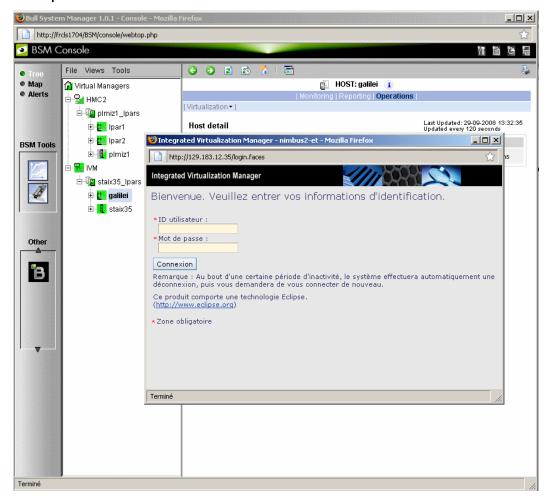

Figure 3-29. IVM activation from Bull System Manager Console

3.4.4.1 Escala Supervision

To see all the services related to an HMC managed Escala logical partition, use the **Virtual Managers** view, click the corresponding platform node (suffixed with VM) and select Monitoring/Status detail menu. The following page is displayed:

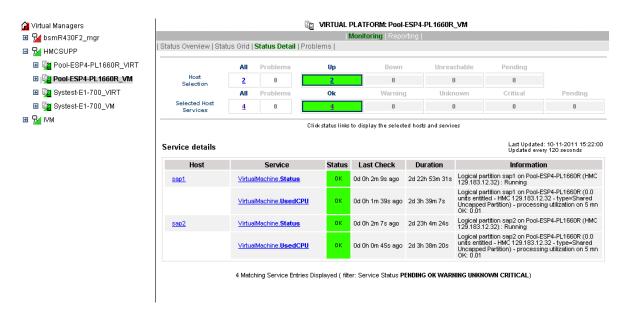

Figure 3-30. HMC managed Logical Partition reported Supervision

To see all the services related to an HMC managed virtualization layers, use the **Virtual Managers** view, click the corresponding platform node (suffixed with VIRT) and select Monitoring/Status detail menu. The following page is displayed:

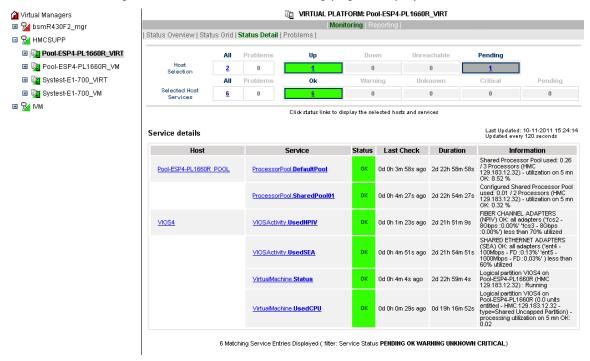

Figure 3-31. HMC Virtualization layer reported supervision

To see all services related to an IVM managed Escala server, use the Virtual Managers view, click the platform node and select Monitoring/Status detail menu. The following page is displayed:

Figure 3-32. Escala IVM reported supervision

3.4.4.2 Escala Reporting

From the host hosting the Vios partition or from host representing the PowerHypervisor layer of HMC managed PL Escala, you can display reporting indicators to see the changes for the utilization of the processing pool.

From any LPAR host, you can display reporting indicators to see the changes in use for the partition CPU.

3.5 Bull Products Server Add-ons

The following Add-ons are used for monitoring Bull Products.

3.5.1 DDFA

Dynamic Domains For Applications (DDFA) software is a tool that can be used on the Linux operating system to simulate the partitioning of a multi-CPU machine at application level. Dynamic Domains for Applications can be used with standard Linux distributions and can be managed using the Webmin standard administration tool.

See the Dynamic Domains for Applications User's Guide (ref 86 A2 63ER) for more information.

You can install DDFA from the Bull Extension Pack for RedHat CD.

Note DDFA runs only on Linux machines and uses a Webmin module for its management. You can download the prerequisite Webmin package from the web site:

http://www.webmin.com

WARNING: You have to verify the URL (http://<hostname>:10000/ddomains/xml.cgi) used by BSM nagios plug-in is trusted by the targeted webmin.

This Add-on creates monitoring links between Bull System Manager and the **DDFA** management webmin module.

The following figure shows the different components used for monitoring:

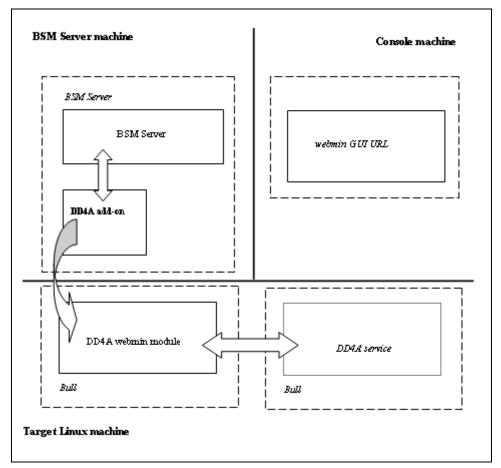

Figure 3-33. DDFA Monitoring Components

Bull System Manager Server Add-ons provide the default Bull product categories, as below.

3.5.1.1 Default Categories & Services Proposed for Linux Hosts

| Targeted OS | Model | Category | Service | Check command |
|-------------|-------|----------------|---------|---------------|
| Linux | Any | DynamicDomains | All | check_dd4a |
| | | | Default | |

Table 3-17. DDF4 categories and services

3.5.1.2 DynamicDomains Category

All Services

For Linux hosts with the Dynamic Domains management tool. This service dynamically checks the global status reported by the associated webmin module for all the Dynamic Domains defined.

Note There is no need to reconfigure the tool to survey newly defined Dynamic Domains.

default Service

For Linux hosts with the Dynamic Domains management tool. This service checks the status of the default Dynamic Domain.

Note When creating a new Dynamic Domain, statically clone the default monitoring service to survey the new dynamic domain.

3.5.1.3 check_DynamicDomains (Linux OS) Nagios Command

The configurable Bull System Manager service check command syntax is:

check_DynamicDomains!<{ALL|<DomainName>}

Default syntax for **DynamicDomains.All** (the service name as defined in Nagios configuration based on the category name and service name defined in BSM configuration):

check_DynamicDomains!ALL

Default syntax for **DynamicDomains.default** (the service name as defined in Nagios configuration based on the category name and service name defined in BSM configuration):

check DynamicDomains!default

Chapter 4. Check Commands for Add-on Customizable Services

This chapter describes the usage of the check commands for the customizable services. These Linux commands run only under CYGWIN on Windows.

4.1 Internal Storage Management Add-ons

The following check commands apply to the internal storage management Add-ons.

4.1.1 BSMGAMTT Add-on

The **check_gamttraid** check command applies to the **BSMGAMTT** Add-on and uses the following shell (PERL) command options.

Usage

```
check_gamttraid -H <host> [-C <community>] [-p <port>] [-t <timeout>]
{ [-A {ALL|<Ct>}] | [-P {ALL|<Ct>.<Ch>.<Tg>}] | [-L {ALL|<Ct>.<Ldn>}] }
[-v <vl>] [-f <f>]
-H, -hostname <host>
                               Hostname or IP address of target to check
-C, -community < community>
                               SNMP community string (defaults to public)
                               SNMP port (defaults to 161)
-p, -port <port>
-t, -timeout <timeout>
                               Seconds before timing out (defaults to Nagios timeout
                               value)
                               Controller board
-A, -adapter ALL | <Ct>
-P, -physical ALL | <Ct>.<Ch>.<Tg>
                               Physical device addr
-L, -logical ALL | <Ct>.<Ldn>
                               Logical drive addr
-v, -verbosity <vl>
                               Verbosity level:
                               0 None
                               1 Adds the <CtrlModel> and the status of all controller
                               boards filtered
                               O Carriage Return in ASCII mode (\n)
-f, -format < f >
                               1 Carriage Return in HTML mode (<br>)
```

Return code

OK (0), WARNING (1), CRITICAL (2), UNKNOWN (3)

- OK
 - All logical drives and all physical devices run normally.
- WARNING
 - At least one logical drive or one physical device is in a WARNING state.
- CRITICAL
 - At least one logical drive or one physical device is in a CRITICAL state.

UNKNOWN
 All other types of processing errors (bad parameter, no response, and so on).

Note In the case of multiple errors, the global state will be the most severe one; CRITICAL > WARNING > OK.

Output

A string composed with a global state descriptor followed, if they exist, by error states of the components concerned (controller, Logical Device, Physical Device).

global state descriptor

The first line shows the global state. The syntax is:

```
GAMTT RAID [CT |PD |LD ]<GlobalStatus>
"CT " if "-A".
"PD " if "-P".
"LD " if "-L".
```

state descriptor by controller

These may be present after the global state descriptor if an error exists.

The syntax is:

```
[ CT(Ct<Ct>) <CtrlModel> <CtrlStatus>
[{LD(Ct<Ct> Nu<Ldn>) <LDType> <LDStatus>[, ] ...}]
[{PD(Ct<Ct> Ch<Ch> Tg<Tg>) <PDType> <PDStatus>[, ] ...}]
...]
```

<GlobalStatus> most severe status detected

<CtrlModel> controller model

<CtrlStatus> most severe state detected for an element of this controller (LD and PD)

<Ct> controller number
<Ldn> logical drive number

<LDType> logical drive type: RAIDx or JBOD

<LDStatus> logical drive status
<Ct> controller number
<Ch> channel number
<Tg> target number

<PDType> physical device type: Disk, Processor, Ctrl Channel,

<PDStatus> physical device status

Examples

If global state is OK:

```
> check_gamttraid -H <host>
GAMTT RAID OK
>
> check_gamttraid -H <host> -P 0.0.1
GAMTT RAID PD OK
>
> check_gamttraid -H <host> -L 0.0
GAMTT RAID LD OK
>
> check_gamttraid -H <host> -v 1
GAMTT RAID OK
CT(Ct0) MegaRAID Ultra320-2x OK
CT(Ct1) DAC960FFX2 OK
CT(Ct2) MegaRAID Ultra320-2x OK
>
> check_gamttraid -H <host> -A 1 -v 1
GAMTT RAID CT OK
CT(Ct1) DAC960FFX2 OK
```

If global state is CRITICAL or WARNING, only the elements concerned are displayed:

```
> check_gamttraid -H <host>
GAMTT RAID CRITICAL
CT(Ct0) MegaRAID Ultra320-2x CRITICAL
PD(Ct0 Ch0 Tg1) Disk Dead
>
> check_gamttraid -H <host> -L 0.1
GAMTT RAID LD CRITICAL
CT(Ct0) MegaRAID Ultra320-2x CRITICAL
LD(Ct0 Nul) RAID5 Critical
```

If return code is UNKNOWN:

```
> check_gamttraid -H <host>
GAMTT RAID UNKNOWN - snmp query timed out
>
```

4.1.2 BSMLSICIM Add-on

The **check_LSICIM** check command applies to the **BSMLSICIM** Add-on and uses the following shell (PERL) command options:

Usage

```
check_LSICIM -H <host> [-C <ctrlname>]
-H, -hostname <host> Hostname or IP address of target to check
-C, -ctrlname <ctrlname> Name of the controller to check
```

Note

The name of the controller must be protected with a quotation mark if the name contains blank characters.

Return code

OK (0), WARNING (1), CRITICAL (2), UNKNOWN (3)

OK

All controllers run normally.

WARNING

At least one controller is in a WARNING state.

CRITICAL

At least one controller is in a CRITICAL state.

UNKNOWN

All other types of processing errors (bad parameter, no response, etc.).

Note

In the case of multiple errors, the global state will be the most severe one; CRITICAL > WARNING > OK.

Output

A string indicates the state of mirroring followed, where applicable, by the component error states (controller, Logical Device, Physical Device) concerned.

If the GlobalStatus determined by the most severe status of components is not OK, the state of the component is reported with the following format:

```
[CT(Ct<Ct>) <CtrlName> <CtrlStatus>
[{> LD(Ct<Ct> Nu<Ldn>) <LDType> <LDStatus>[, ] ...}]
[{ - PD(Ct<Ct> Ch<Ch> Tg<Tg>) <PDManufacturer> <PDModel> <PDStatus>[, ] ...}]
[{> PD(Ct<Ct> Ch<Ch> Tg<Tg>) <PDManufacturer> <PDModel> <PDStatus>[, ] ...}]
```

<Ct> controller number <CtrlModel> controller model

<CtrlStatus> worst state detected for an element of this controller (LD and PD)

<Ldn> logical drive number <LDType> logical drive type: IM

<LDStatus> logical drive status as reported by the LSI CIM provider

<Ch> channel number <Tg> target number

<PDManufacturer> physical device manufacturer <PDModel> physical device model

<PDStatus> physical device status as reported by the LSI CIM provider

Examples

```
$ ./check_LSICIM -H 172.31.50.71
: LSI SCSI storage - Integrated Mirroring not available -
LSI SCSI storage - Integrated Mirrored available -
CT(0) LSI 53C1030 CRITICAL
> LD(Ct0 Ch2 Tg0) IMVolume: Degraded Redundancy
- PD(Ct0 Ch3 Tg0) SEAGATE ST373454LC: Error

$ ./check_LSICIM -H 172.31.50.71 -C 'LSI SCSI1030 - 0'
> CT(0) LSI 53C1030 OK
$ ./check_LSICIM -H 172.31.50.71 -C 'LSI SCSI1030 - 0'
> CT(0) LSI 53C1030 CRITICAL
- PD(Ct0 Ch0 Tg0) MAXTOR ATLAS10K4_36SCA CRITICAL
```

4.1.3 BSMMegaRaidSAS Add-on

The check_MegaRaidSAS(_IR check command applies to the BSMGAMTT Add-on and uses the following shell (PERL) command options.

Usage

```
check_MegaRaidSAS(_IR) -H <host> [-C <community>] [-p <port>]
[-L {ALL|<Ct.Ldn>}] } [-f <f>]
                            Hostname or IP address of target to check
-H, -hostname <host>
-C, -community < community>
                            SNMP community string (defaults to public)
                            SNMP port (defaults to 161)
-p, -port <port>
                            Seconds before timing out (defaults to Nagios timeout
-t, -timeout <timeout>
                            value)
-A, -adapter ALL | <Ct>
                            Controller board
-P, -physical ALL | <Ct.Pdn>
                            Physical device identifier
-L, -logical ALL | <Ct.Ldn>
                            Virtual drive identifier
-f. -format <f>
                            O Carriage Return in HTML mode (<br>)
                            1 Carriage Return in ASCII mode (\n)
```

Return code

OK (0), WARNING (1), CRITICAL (2), UNKNOWN (3)

- OK
 - All logical drives and all physical devices run normally.
- WARNING
 - At least one logical drive or one physical device is in a WARNING state.
- CRITICAL
 - At least one logical drive or one physical device is in a CRITICAL state.
- UNKNOWN
 - All other types of processing errors (bad parameter, no response, and so on).

Note

In the case of multiple errors, the global state will be the most severe one; CRITICAL > WARNING > OK.

Output

A string composed of a global state descriptor followed, if they exist, by error states of the component (controller, Logical Device, Physical Device) concerned.

Global state descriptor

The first line shows the global state. The syntax is:

```
Megaraid Sas [CT |PD |LD ]<GlobalStatus>
"CT " if "-A".
"PD " if "-P".
"VD " if "-L".
```

state descriptor by controller

These may be present after the global state descriptor if an error exists.

The syntax is:

<CtrlModel> controller model

<CtrlStatus> most severe state detected for a controller <id> controller or Drive or Logical drive index

<RAIDLevel> RAID level (0,1,5,10,50,60)

<VDStatus> logical drive status

<PDType> physical device type: Disk, Processor, Ctrl Channel,

<PDStatus> physical device status

<SN> serial number of physical drive

Examples:

• If the global state is OK:

```
> check_MegaRaidSAS -H <hostname>
MegaRAID SAS CT OK
CTO MegaRAID SAS 8408E OK
PD: 4
VD: 2 ( RAID0, 1 RAID1)
> check_MegaRaidSAS -H < hostname > -A ALL
MegaRAID SAS CT OK
CTO MegaRAID SAS 8408E OK
PD: 4
VD: 2 ( RAID0, 1 RAID1)
> check_MegaRaidSAS-H < hostname > -L ALL
MegaRAID SAS VD OK
> check_MegaRaidSAS-H < hostname > -P ALL
MegaRAID SAS PD OK
> check_MegaRaidSAS-H < hostname > -P 0.2
MegaRAID SAS PD OK
> check_MegaRaidSAS-H < hostname > -L 0.1
MegaRAID SAS VD OK
```

 If the global state is CRITICAL or WARNING, only the elements concerned are displayed:

```
> check_MegaRaidSAS -H <hostname> -L ALL
MegaRAID SAS VD WARNING
VD(CT0 DEV0) RAID1 degraded
VD(CT0 DEV2) RAID1 degraded>
> check_MegaRaidSAS -H <hostname>
MegaRAID SAS CT CRITICAL
CT0 MegaRAID SAS 8408E CRITICAL
PD: 4
VD: 2 ( RAID0, 1 RAID1)
PD(CT0 DEV0 ENC1 SLOT0 SN50010b90000972e2) DISK offline>
VD(CT0 DEV0) RAID1 degraded
VD(CT0 DEV1) RAID0 offline>
```

• If the return code is UNKNOWN:

```
> check_MegaRaidSAS-H <hostname>
MegaRAID SAS UNKNOWN - no MegaRAID SAS Adapter present
```

4.2 External Storage Management

The following check commands apply to the external storage management Add-ons.

4.2.1 BSMStoreWayFDA

The **check_necfda** command applies to the **BSMStoreWayFDA** Add-on and uses the following shell (PERL) command options:

Usage

```
check_necfda -H <host> [-C <community>] [-p <port>] [-t <timeout>] [-f
<f>1
-H, -hostname <host>
                               Hostname or IP address of the target to check
-C, -community < community>
                               SNMP community string (defaults to public)
                               SNMP port (defaults to 161)
-p, -port <port>
                               Seconds before timing out (defaults to Nagios timeout
-t, -timeout <timeout>
                               value)
-f, -format <f>
                               O Carriage Return in ASCII mode (\n)
                               1 Carriage Return in HTML mode (<br>)
check necfda -help
-h, -help
                  Display help
check necfda -version
-V, -version
                  Display version
```

Return code

```
OK (0), WARNING (1), CRITICAL (2), UNKNOWN (3)
```

Output

The first line shows the global state in the following format:

```
necfda <GlobalStatus>
```

<GlobalStatus> Most severe state detected for a controller.

Examples:

If the global state is OK

```
> check_necfda -H <host>
necfda OK
>
```

- If the global state is CRITICAL or WARNING, only the errors are displayed.
- When the return code is UNKNOWN:

```
> check_necfda -H <host>
necfda CRITICAL
>
> check_necfda -H <host>
necfda WARNING
>
```

```
> check_necfda -H <host>
necfda UNKNOWN - snmp query timed out
>
> check_necfda -H <host>
necfda UNKNOWN - no data received
```

4.2.2 BSMEmcClariion

The **check_EmcClariion** command applies to the **EmcClariion** Add-on and uses the following shell (PERL) command options:

Usage

```
check_EmcClariion -H <host> [-C <community>] [-p <port>] [-t <timeout>]
[-f <f>]
                               Hostname or IP address of the target to check
-H, -hostname <host>
-C, -community < community>
                               SNMP community string (defaults to public)
                               SNMP port (defaults to 161)
-p, -port <port>
-t, -timeout <timeout>
                               Seconds before timing out (defaults to Nagios timeout
                               value)
-f, -format < f >
                               O Carriage Return in HTML mode (<br>)
                               1 Carriage Return in ASCII mode (\n)
check_EmcClariion -help
-h, -help
                  Display help
check_EmcClariion -version
                  Display version
-V, -version
```

Return code

OK (0), WARNING (1), CRITICAL (2), UNKNOWN (3)

Output

The first line shows the global state in the following format:

```
EmcClariion <GlobalStatus>
```

<GlobalStatus> Most severe state detected for a controller.

Examples:

If the global state is OK

```
> check_EmcClariion -H <host>
EmcClariion CX200 B-APM00024600159 OK
```

If the global state is CRITICAL or WARNING, only the errors are displayed:

```
> check_EmcClariion -H <host>
EmcClariion CX200 B-APM00024600159 CRITICAL
>
    check_EmcClariion -H <host>
EmcClariion CX200 B-APM00024600159 WARNING
>
```

• When the return code is UNKNOWN:

```
> check_EmcClariion -H <host>
EmcClariion UNKNOWN - snmp query timed out
>
> check_EmcClariion -H <host>
EmcClariion UNKNOWN - no data received
```

4.2.3 BSMNetApp

The **BSMNetApp** Add-on uses the following check commands:

4.2.3.1 check-netapp-cpuload

check-netapp-cpuload uses the following shell (PERL) command options:

Usage

```
check_snmp -H <host> -C <community> -o <OID> -w <warning range>]
-c <critical range> -u <unit label> -l <label>
-H, -hostname <host>
                               Hostname or IP address of the target to check
                               SNMP community string (defaults to public)
-C, -community < community>
-o, -oid <OID>
                               object identifier to query
                               range which will not result in a WARNING status
-w, -warning <int>
                               range which will not result in a CRITICAL status
-c, -critical <int>
-u, -units <string>
                               units label for output data (e.g., 'sec.', '%')
-l, -label <string>
                               prefix label for output data from plugin
                               (default: -s 'SNMP')
```

Return code

```
OK (0), WARNING (1), CRITICAL (2), UNKNOWN (3)
```

Output

The output shows the state in the following format:

```
CPU LOAD <Status> - <int> %

<Status> status of the command
<int> CPU load.
```

Examples:

• If the state is OK

```
> check_snmp -H $HOSTADDRESS$ -C public -o .1.3.6.1.4.1.789.1.2.1.3.0
-w 90 -c 95 -u '%' -l "CPU LOAD"
CPU LOAD OK - 8%
>
```

If the global state is CRITICAL or WARNING:

```
> check_snmp -H $HOSTADDRESS$ -C public -o .1.3.6.1.4.1.789.1.2.1.3.0
-w 90 -c 95 -u '%' -l "CPU LOAD"
CPU LOAD WARNING - 92%
```

```
> check_snmp -H $HOSTADDRESS$ -C public -o .1.3.6.1.4.1.789.1.2.1.3.0
-w 90 -c 95 -u '%' -l "CPU LOAD"
CPU LOAD CRITICAL - 99%
```

4.2.3.2 check-netapp-numdisks

check-netapp-numdisks uses the following shell (PERL) command options:

Usage

```
check_snmp -H <host> -C <community> -o <OID1,OID2,OID3,OID4>
-u <unit label> -l <label>
-H, -hostname <host> Hostname or IP address of the target to check
-C, -community <community> SNMP community string (defaults to "public")
-o, -oid <OID> object identifiers to query
-u, -units <string> units label for output data (e.g., 'sec.', '%')
-l, -label <string> prefix label for output data from plugin (default: -s 'SNMP')
```

Return code

```
OK (0), WARNING (1), CRITICAL (2), UNKNOWN (3)
```

Output

The output shows the state in the following format:

```
<Status> - <int> Total Disks <int> Active <int> Spare <int> Failed <Status> status of the command <int> number of disks.
```

Examples:

If the state is OK

```
> check_snmp -H $HOSTADDRESS$ -C public -o
.1.3.6.1.4.1.789.1.6.4.1.0,.1.3.6.1.4.1.789.1.6.4.2.0,.1.3.6.1.4.1.78
9.1.6.4.8.0,.1.3.6.1.4.1.789.1.6.4.7.0 -u 'Total
Disks','Active','Spare','Failed' -l ""
OK - 8 Total Disks 7 Active 1 Spare 0 Failed
>
```

If the state is WARNING

```
> check_snmp -H $HOSTADDRESS$ -C public -o
.1.3.6.1.4.1.789.1.6.4.1.0,.1.3.6.1.4.1.789.1.6.4.2.0,.1.3.6.1.4.1.78
9.1.6.4.8.0,.1.3.6.1.4.1.789.1.6.4.7.0 -u 'Total
Disks','Active','Spare','Failed' -l ""
WARNING - 8 Total Disks 6 Active 1 Spare 1 Failed
>
```

4.2.3.3 check-netapp-failedfans

check-netapp-failedfans uses the following shell (PERL) command options:

Usage

```
check_snmp -H <host> -C <community> -o <OID> -l <label>
-H, -hostname <host> Hostname or IP address of the target to check
```

-C, -community <community> SNMP community string (defaults to "public")

-o, -oid <OID> object identifiers to query

-l, -label <string> prefix label for output data from plug-in

(default: -s 'SNMP')

Return code

OK (0), WARNING (1), CRITICAL (2), UNKNOWN (3)

Output

The output shows the state in the following format:

```
Fans <Status> - < msg>
```

<Status> status of the command <msg> msg concerning failed fans.

Examples:

If the state is OK

```
> check_snmp -H $HOSTADDRESS$ -C public -o .1.3.6.1.4.1.789.1.2.4.3.0
-l "Fans"
```

Fans OK - There are no failed fans. >

If the state is WARNING

```
> check_snmp -H $HOSTADDRESS$ -C public -o .1.3.6.1.4.1.789.1.2.4.3.0
-l "Fans"
Fans WARNING - There are 2 failed fans.
```

4.2.3.4 check-netapp-failedpwr

check-netapp-failedpwr uses the following shell (PERL) command options:

Usage

```
check_snmp -H <host> -C <community> -o <OID> -1 <label>
-H, -hostname <host> Hostname or IP address of the target to check
-C, -community <community> SNMP community string (defaults to "public")
-o, -oid <OID> object identifiers to query
-I, -label <string> prefix label for output data from plugin (default: -s 'SNMP')
```

Return code

OK (0), WARNING (1), CRITICAL (2), UNKNOWN (3)

Output

The output shows the state in the following format:

```
Power <Status> - < msg>
```

<Status> status of the command

<msg> msg concerning failed power supplies.

Examples:

• If the state is OK

```
> check_snmp -H $HOSTADDRESS$ -C public -o .1.3.6.1.4.1.789.1.2.4.5.0
-l "Power"
Power OK - There are no failed power supplies.
>
```

If the state is WARNING

```
> check_snmp -H $HOSTADDRESS$ -C public -o .1.3.6.1.4.1.789.1.2.4.5.0
-l "Power"
Power WARNING - There are 2 failed power supplies.
```

4.2.3.5 check_netapp_globalstatus

check_netapp_globalstatus uses the following shell (PERL) command options:

Usage

```
check_NetAppGlobalStatus -H <host> [-C <community>] [-p <port>]
[-t <timeout>] [-f <f>]
                              Hostname or IP address of the target to check
-H, -hostname <host>
                              SNMP community string (defaults to public)
-C, -community < community>
-p, -port <port>
                              SNMP port (defaults to 161)
-t, -timeout <timeout>
                              Seconds before timing out (defaults to Nagios timeout
                              value)
-f, -format <f>
                              O Carriage Return in HTML mode (<br>)
                               1 Carriage Return in ASCII mode (\n)
check_NetAppGlobalStatus -help
-h, -help
                  Display help
check_NetAppGlobalStatus -version
                  Display version
-V, -version
```

Return code

```
OK (0), WARNING (1), CRITICAL (2), UNKNOWN (3)
```

Output

```
The output shows the global state in the following format:
```

```
<GlobalStatus> - <msg>
<GlobalStatus> Global state of the NetApp storage system.
<msg> message explaining the global state
```

Examples

• If the global state is OK

```
> check_NetAppGlobalStatus -H <host>
OK - The system's global status is normal
>
```

• If the global state is CRITICAL or WARNING:

```
> check_NetAppGlobalStatus -H <host>
WARNING - /vol/luns is full (using or reserving 100% of space and 0% of inodes, using 63% of reserve).
```

4.2.3.6 check_netappvol

check_netappvol uses the following shell (PERL) command options:

Usage

```
\label{lem:check_NetAppVol} $$ -H < host> [-C < community>] [-p < port>] [-t < timeout>] [-f < f>] $$
```

-H, -hostname <host> Hostname or IP address of the target to check
-C, -community <community> SNMP community string (defaults to public)

-p, -port <port> SNMP port (defaults to 161)

-t, -timeout <timeout> Seconds before timing out (defaults to Nagios timeout

value)

-f, -format <f> O Carriage Return in HTML mode (
)

1 Carriage Return in ASCII mode (\n)

 $\verb|check_NetAppGlobalVol -help|$

-h, -help Display help

check_NetAppGlobalVol -version

-V, -version Display version

Return code

```
OK (0), WARNING (1), CRITICAL (2), UNKNOWN (3)
```

Output

The first line shows the global volume state in the following format:

```
NetApp <model> <GlobalVolumeStatus>
```

<GlobalVolumeStatus> Global state of all volumes of the NetApp storage system.

<model> model of NetApp storage system

The following lines show the status of each volume

Volume <name>, <status> (<raidtype, <voltype>, <aggregateName>)

Examples:

If the global state is OK

```
> check_NetAppGlobalStatus -H <host>
NetApp FAS3020 RAID OK
Volume vol0, online (raid_dp, flexible, aggr0)
Volume BULL_TRAVAIL, online (raid_dp, flexible, BULL)
Volume luns, online (raid_dp, flexible, BULL)
Volume GORKI, online (raid_dp, flexible, aggr1)
>
```

If the global state is CRITICAL or WARNING:

```
> check_NetAppGlobalStatus -H <host>
NetApp FAS3020 RAID WARNING
Volume vol0, online (raid_dp, flexible, aggr0)
Volume BULL_TRAVAIL, online (raid_dp, flexible, BULL)
Volume luns, online (raid_dp, flexible, BULL)
Volume GORKI, offline (raid_dp, flexible, aggr1)
```

4.2.3.7 check_netappraid

check_netappraid uses the following shell (PERL) command options:

Usage

```
check_NetAppGlobalRaid -H <host> [-C <community>] [-p <port>] [-t
<timeout>] [-f <f>]
-H, -hostname <host>
                               Hostname or IP address of the target to check
-C, -community < community>
                               SNMP community string (defaults to public)
                               SNMP port (defaults to 161)
-p, -port <port>
-t, -timeout <timeout>
                               Seconds before timing out (defaults to Nagios timeout
                               value)
-f. -format <f>
                               O Carriage Return in HTML mode (<br>)
                               1 Carriage Return in ASCII mode (\n)
check_NetAppRaid -help
-h, -help
                  Display help
check_NetAppRaid -version
-V, -version
                  Display version
```

Return code

```
OK (0), WARNING (1), CRITICAL (2), UNKNOWN (3)
```

Output

The first line shows the global state of all RAID groups in the following format:

```
NetApp <model> <GlobalRgStatus>
```

```
<GlobalRgStatus> Global state of all raid groups of the NetApp storage system.

<model> model of NetApp storage system
```

The following lines show the status of each RAID group

```
RAID group <name> <status>
```

Examples

If the global Raid group state is OK

```
> check_NetAppRaid -H <host>
NetApp FAS3020 RAID OK
RAID group /aggr0/plex0/rg0 active
RAID group /BULL/plex0/rg0 active
RAID group /aggr1/plex0/rg0 active
>
```

• If the global Raid group state is CRITICAL or WARNING:

```
> check_NetAppRaid -H <host>
NetApp FAS3020 RAID WARNING
RAID group /aggr0/plex0/rg0 active
RAID group /BULL/plex0/rg0 active
RAID group /aggr1/plex0/rg0 reconstructionInProgress
>
```

4.2.4 BSMWaterCooledDoor

The **BSMWaterCooledDoor** Add-on uses the **check_sensor** check command that uses the following shell (PERL) command options:

Usage

```
check_sensor [-h] -m model [-H host] [-u user] [-p password] -s sensorid
[-F factor] [-c lowercrit] [-w lowerwarn] [-W upperwarn] [-C uppercrit]
-h
                  Help
-m model
                  Remote host model: ipmilan
-H host
                  Remote host name or ipaddr
                  Remote SMU username
-u user
                  Remote SMU or MWA password
-p password
-s sensorid
                  Specify the sensor id string
-F factor
                  Specify the factor to apply to the reading value
-c lowercrit
                  Specify the sensor lower critical level
                  Specify the sensor lower warning level
-w lowerwarn
                  Specify the sensor upper critical level
-C uppercrit
-W upperwarn
                  Specify the sensor upper warning level
```

Return code

OK(0), WARNING(1), CRITICAL(2), UNKNOWN(3).

Output

The output shows the state and the value of the sensor in the following format:

```
<sensor status> : <value>
```

Examples

```
> check_sensor -m ipmilan -H 172.31.50.71 -u super -p pass -s 'Pwr
Consumption'
OK : 142.480 Watts
>
```

```
> check_sensor -m ipmilan -H 172.31.50.71 -u super -p pass -s 'Valve
Vperture'
OK : 21.750 %
>
> check_sensor -m ipmilan -H 172.31.50.71 -u super -p pass -s 'Air
Pressure' -F 1000
OK : 19 Pa
>
check_sensor -m ipmilan -H 172.31.50.71 -u super -p pass -s 'Average
Temp.'
OK : 18.3 degrees C
```

4.2.5 BSMStoreWayDPA

The **BSMStoreWayDPA** Add-on uses the **check_StoreWayDPA** check command that uses the following shell (PERL) command options:

Usage

```
check_StoreWayDPA -H <host> [-C <community>] [-p <port>] [-t <timeout>]
[-f <f>]
-H, -hostname <host>
                               Hostname or IP address of the target to check
-C, -community < community>
                               SNMP community string (defaults to public)
                               SNMP port (defaults to 161)
-p, -port <port>
-t, -timeout <timeout>
                               Seconds before timing out (defaults to Nagios timeout
                               value)
-f. -format <f>
                               O Carriage Return in HTML mode (<br>)
                               1 Carriage Return in ASCII mode (\n)
check_StoreWayDPA -help
-h, -help
                  Display help
check_StoreWayDPA -version
-V, -version
                  Display version
```

Return code

OK (0), WARNING (1), CRITICAL (2), UNKNOWN (3)

Output

The first line shows the task state in the following format:

```
StoreWay DPA <TaskStatus>
```

<TaskStatus> Most severe task state detected on a StoreWay DPA system.

Examples

If the task state is OK

```
> check_StoreWayDPA -H <host>
StoreWay DPA OK
>
```

If the global state is CRITICAL, only the tasks with state stopped are displayed:

```
> check_StoreWayDPA -H <host>
StoreWay DPA CRITICAL
Backup Engine stopped
> 
> check_StoreWayDPA -H <host>
StoreWay DPA CRITICAL
Task Launcher stopped
> 
> check_StoreWayDPA -H <host>
StoreWay DPA CRITICAL
Backup Engine and Task Launcher stopped
```

• When the return code is UNKNOWN:

```
> check_StoreWayDPA -H <host>
StoreWay DPA UNKNOWN - snmp query timed out
>
> check_StoreWayDPA -H <host>
StoreWay DPA UNKNOWN - no data received
>
```

4.2.6 BSMSwitchBrocade

The **BSMSwitchBrocade** Add-on uses the **check_brocade** check command with the following shell (PERL) command options:

Usage

Return code

```
OK (0), WARNING (1), CRITICAL (2), UNKNOWN (3)
```

Output

The output displays the state of the sensor.

Examples:

If the task state is OK

```
> check_fcsw.pl -H <host> -c switch
Global switch status is OK
>
> check_fcsw.pl -H <host> -c port
All 16 FC ports are OK
>
> check_fcsw.pl -H <host> -c temp
All 4 Temperature Sensors are OK
>
> check_fcsw.pl -H <host> -c fan
All 4 Fans are OK
>
```

When the return code is UNKNOWN:

```
> check_fcsw.pl -H <host> -c switch
Cannot access to Switch status, Cannot acces to Switch name
>
> check_fcsw.pl -H <host> -c temp
Cannot access to sensors states
>
> check_fcsw.pl -H <host> -c port
Cannot access to FC port states
```

4.2.7 BSMPDU-APC

The **BSMPDU-APC** Add-on uses the **check_PDUAPC** check command with the following shell (PERL) command options:

Usage

```
check_PDUAPC -H <host IP address> -s <action> [-p <port>] [-C
<community>] [-T <snmp timeout>]
-H <host>
                     Hostname or IP address of the target to check
-c <action>
                     Status: gets the APC PDU power supply(ies) status
                     Consumption: gets the APC PDU power consumption (in Watts)
                     Outlets: gets the APC PDU outlets status
                     snmp port number (default value: 161)
-p <port>
-C <community>
                     snmp community (default value: public)
-T <timeout>
                     snmp timeout (default value: 30 seconds)
-h, -help
                     displays help
```

Return code

```
OK (0), WARNING (1), CRITICAL (2), UNKNOWN (3)
```

Output

The output displays the APC PDU power supply(ies) state, the APC PDU global power consumption or the APC PDU outlets state.

Examples:

Action Status

```
Return code OK:
 > check_PDUAPC -H 129.182.6.174 -a Status
 Power Distribution Unit: 129.182.6.174, MODEL: "AP7922", Serial Nb:
 "ZA0909003404", Firm Rev: "v3.5.7"
 All Power Supplies OK
     Return code WARNING:
 > check_PDUAPC -H 129.182.6.174 -a Status
 Power Distribution Unit: 129.182.6.174, MODEL: "AP7922", Serial Nb:
 "ZA0909003404", Firm Rev: "v3.5.7"
 Power Supply 1 OK, Power Supply 2 FAILED
     Return code CRITICAL:
 > check_PDUAPC -H 129.182.6.174 -a Status
 Power Distribution Unit: 129.182.6.174, MODEL: "AP7922", Serial Nb:
 "ZA0909003404", Firm Rev: "v3.5.7"
 All Power Supplies FAILED
Action Consumption:
     Return code OK:
 > check_PDUAPC -H 129.182.6.174 -a Consumption
 Power OK: Reading 0 Watts
     Return code WARNING:
 > check_PDUAPC -H 129.182.6.174 -a Consumption
 Power WARNING: Reading 6000 > Threshold 5520 Watts>
     Return code CRITICAL:
 > check_PDUAPC -H 129.182.6.174 -a Consumption
 Power CRITICAL: Reading 8000 > Threshold 7360 Watts
Action Outlets:
     Return code OK:
 > check_PDUAPC -H 129.182.6.174 -a Outlets
 Power Distribution Unit: 129.182.6.174, MODEL: "AP7922", Serial Nb:
 "ZA0909003404", Firm Rev: "v3.5.7"
 Outlets(1 - 16) power: On(1)
 > check_PDUAPC -H 129.182.6.174 -a Outlets
 Power Distribution Unit: 129.182.6.174, MODEL: "AP7922", Serial Nb:
 "ZA0909003404", Firm Rev: "v3.5.7"
 Outlets(1,3,5,7,9,11,12,14,16) power: On(1)
 Outlets(2,4,6,8,10,13,15) power: Off(2)
     Return code WARNING:
 > check_PDUAPC -H 129.182.6.174 -a Outlets
 Power Distribution Unit: 129.182.6.174, MODEL: "AP7922", Serial Nb:
 "ZA0909003404", Firm Rev: "v3.5.7"
 Outlets(1 - 16) power: Off(2)
```

4.2.8 BSMIPDU

The **BSMIPDU** Add-on uses the **check_IPDU** check command with the following shell (PERL) command options:

Usage

check_IPDU -H <host IP address> -a <action> [-p <port>] [-C <community>]
[-t <snmp timeout>] [-o <outlet>]

-H <host> Hostname or IP address of the target to check

-a <action> Status : gets the IPDU global status

Consumption : gets the global IPDU power consumption (in Watts)

OutletsConso : gets the power consumption for one or all IPDU

outlets

Outlets Voltage: gets the output voltage for one or all IPDU outlets

Voltage: gets the input and output voltage and frequency of the

IPDU

Temperature: gets the temperature of the IPDU

Humidity: gets the humidity for the IPDU

-p <port> snmp port number (default value: 161)
-C <community> snmp community (default value: public)
-t <timeout> snmp timeout (default value: 50 seconds)

-o <outlet> outlet number (default value: all); available only for actions

OutletsConso and OutletsVoltage

-h, -help displays help

Return code

OK (0), WARNING (1), CRITICAL (2), UNKNOWN (3)

Output

The output displays for action Status the IPDU global state and additional information about the IPDU host, for action Consumption the IPDU global power consumption and additional metrics as performance data, for action OutletsConso the power consumption per outlet and additional metrics as performance data, for action OutletsVoltage the output voltage per outlet and additional metrics as performance data, for action Voltage the input and output voltage and frequency and additional metrics as performance data, for action Temperature the temperature of the IPDU and additional metrics as performance data and for action Humidity the humidity of the IPDU and additional metrics as performance data.

Examples:

Action Status

```
$ check_IPDU -H 172.16.113.41 -a Status
Status OK - MODEL: "IBM DPI C13 BULK", Device Firmware Version:
"0202.0008", Agent Firmware Versio: "IBM DPI V0210.0001"
INPUT Frequency: 50 Hz, Voltage: 240.4 volts, Current: 6.2 amp.
OUTPUT VA rating: 14950, frequency: 50 Hz, total power: 1352 watts,
VA: 1493 volt-amps.
```

Action Consumption:

```
> check_IPDU -H 172.16.113.41 -a Consumption
Consumption OK - OVERALL OUTPUT: 1341 watts|totalpower=
1341watts;;;547;1782 wattshours=1346Wh;;;0;1466
```

Action OutletsConso:

```
> check_IPDU -H 172.16.113.41 -a OutletsConso
Outlet1 ("[13] ESP4 - PL1660R") : 198 watts

> check_IPDU -H 172.16.113.41 -a Humidity
Humidity CRITICAL - 11%|humidity=11%;22:78;20:80;10;44
>
```

Action Temperature

```
> check_IPDU -H 172.16.113.41 -a Temperature
Temperature OK - 30°C|Temperature=30C;16:32;16:32;23;42
AmbientTemperature=37C;;;29;46
>
```

4.3 Virtualization Management

The following check commands apply to the virtualization management Add-ons.

4.3.1 BSMVMwareVS

The Nagios check commands used by **BSMVMwareVC** Add-on use the shell (PERL) **check_virtualcenter.pl** command.

Usage

where:

-server <vCenter> Hostname or IP address of the vCenter

-vmname <VM_id> Name of the VM (in vCenter context)

-hostname <ESX_id> Name of the ESX host (in vCenter context)

-stat <tmetric> Type of performance metric to check.

See below for valid VMware metrics

-warn <nb> Warning threshold for performance statistics

-crit <nb> Critical threshold for performance statistics

-indic <metric list> Additional performance metrics to use as reporting indicator.

See below for valid VMware metrics

-help Display help

Supported host's metrics:

- cpu.usage.average
- sys.resourceCpuUsage.average
- mem.usage.average
- mem.consumed.average
- mem.granted.average
- mem.vmmemctl.average
- mem.active.average
- mem.swapused.average
- mem.sharedcommon.average
- net.usage.average
- net.transmitted.average
- net.received.average
- net.droppedRx.summation
- net.packetsRx.summation
- net.droppedTx.summation
- net.packetsTx.summation
- disk.usage.average
- disk.commands.summation
- disk.numberRead.summation
- disk.numberWrite.summation

- disk.read.average
- disk.write.average
- disk.deviceLatency.average
- disk.kernelLatency.average
- disk.totalLatency.average
- disk.queueLatency.average

Supported VM's metrics:

- cpu.usage.average
- cpu.used.summation
- cpu.ready.summation
- mem.usage.average
- mem.consumed.average
- mem.granted.average
- mem.vmmemctl.average
- mem.active.average
- net.usage.average
- net.transmitted.average
- net.received.average
- net.droppedRx.summation
- net.packetsRx.summation
- net.droppedTx.summation
- net.packetsTx.summation
- disk.usage.average
- disk.commands.summation
- disk.numberRead.summation
- disk.numberWrite.summation
- disk.read.average
- disk.write.average

Return code

OK(0), WARNING(1), CRITICAL(2), UNKNOWN(3).

Output

The output has the following format:

```
<VMware name>: <metric label> (<counter type>) = <value> (sampling
period <period>
```

The VMware name is the name of the host or VM as set in vCenter or ESX

The metric label is those defined in VMware.

Examples

Example 1:

```
check_vsphere.pl -server 129.182.6.57 -hostname 172.31.50.55 172.31.50.55: Nothing to report about this host.
```

The ESX status returned is determined by the vCenter server.

Example 2:

```
check_vsphere.pl --server 129.182.6.57 -hostname 172.31.50.55 -stat
mem.usage.average -crit 80 -warn 70

172.31.50.55: Memory Usage (Average) = 36.65 (sampling period 20 s)
```

The status returned is dependant on the threshold setting. In this example, the status returned is good.

Example 3:

```
$ ./check_vsphere.pl --server 129.182.6.57 --hostname 172.31.50.55 --stat
mem.usage.average --crit 90 --warn 80 --indics mem.consumed.aver>

172.31.50.55: Memory Usage (Average) = 36.65 (sampling period 20
s) | Memory_Usage=36.65%;80;90;0;100 Memory_Consumed=61493.32kb;;;
Memory_Granted=62800.12kb;;;;
```

Output returns also additional metrics as performance data.

Failure case

Example 1:

```
172.16.115.100: information status for this host is not available (/opt/BSMServer/engine/tmp/VCcache1721611358.pm not found)has
```

This output indicates that the collect task has not started or has failed to collect information from vCenter.

Check the following:

- The task has been enabled in BSM
- The task is scheduled to run periodically (see the collectVMvCenter.log log file)
- If the failure has occurred during the collect process (see the log file vcenter.err)

Example 2:

```
vmx: out-of-date status information (Wed Nov 4 14:35:11 2009) - vmx: This virtual machine is powered off or suspended.
```

This output indicates that the collect task has not been scheduled recently, or has failed to collect information from vCenter.

Check the following:

- The task is still enabled in BSM
- The task has been scheduled recently (see the collectVMvCenter.log log file)
- If the failure has occurred during the collect process (see the vcenter.err log file)

4.3.2 BSMEscalaLpar

The **Nagios** check commands used by **BSMEscalaLPAR** Add-on use the shell (PERL) **check_NSM_escala_lpar** command.

Usage

```
check_NSM_escala_lpar -M manager [HMC|IVM] -H <netname> -U <remote_user>
-I <identity_file> [-l <lpar_name>] [-p <poolname>] [-S <hoststate>]
[-i <STATUS|CPU|POOL>] [-e sample_time] [-w <warn>%] [-c <crit>%]
[-N < name>] [-t timeout]
```

-M <manager> Type of manager used to retrieve plugin information. Available

value are:

IVM, when the Escala is managed by an IVM installed on Vios

partition,

HMC, when the Escala is managed by a remote station.

-H < netname> Hostname or IP address of the manager used for checking

-U <remote_user> User for remote connection

-I <identity_file> Name of the file from which the identity (private key) for RSA or

DSA authentication is read. The file must be localized into the directory <BSM Installation Directory>/engine/etc/ssh. To use it as authentication file for Vios platform, you have to install the

corresponding public key on the VIO server.

-N < name> Name of the CEC or Vios LPAR (used in output of the plugin

related to a given logical partition).

-l <lpar_name> Name of the logical partition to check.

-p <poolname> Name of the processing pool.

-S <hoststate> Nagios status of the lpar or pool host.

The status is passed by Nagios. If the status is not UP, the info is

not checked.

-i <check information> Available values are:

STATUS (to check the status of the VIO server or of a logical

partition),

POOL (to check the utilization of the processing pool),

CPU (to check the utilization of the CPU entitled to a partition).

Default value is STATUS

-e <sample time> Sample time in minutes used to perform calculation on utilization.

Default value is 5.

-w <warnThreshold> Warning threshold-c <criticalThreshold> Critical threshold.-h, -help Display help

Return code

OK(0), WARNING(1), CRITICAL(2), UNKNOWN(3).

Output

The output depends on the type of check performed, as shown in the examples below.

check_vios _status

The check_NSM_escala_lpar shell is called using the following syntax:

```
check_NSM_escala_lpar -M IVM -H <vios_netName> -N <server_name> -U <user>
-I <identity_file> -i status
```

Output

Only two states are possible for Vios status: OK or UNKNOWN:

for OK state, the output is "Virtual I/O Server state: Operating"

for UNKNOWN state, the output is "Unable to determine Virtual I/O Server state", following the reason.

Note The check_vios_status command is dependent on the state of the Vios system given by the lssyscfg IVM command.

Example

```
check_NSM_escala_lpar -H ivml -U padmin -I id_dsa_nsm -I status
```

```
Output: Virtual I/O Server state: Operating
```

Return code: ok.

check_vios_used_pool case

The check_NSM_escala_lpar shell is called using the following syntax:

```
check_NSM_escala_lpar -M IVM -H <vios_netName> -U <user>
-I <identity_file> -N <server_name> -i POOL -e <sample_time> -w <warn>%
-c <crit>%
```

Output

```
Shared Procesor Pool Used (nbCPU / CPUTotal units entitled) - utilization on <sampleTime> mn <check_status>: <utilization percent>%
```

Note The check_vios_used_pool command is based on the pool_cycle metrics (total_pool_cycle, utilized_pool_cycle) obtained by the **Islparutil** IVM command.

It requires that the data collection is activated by the **chlparutil** command: chlparutil -r config -s 30

Example

```
check_NSM_escala_lpar -H 192.168.207.60 -U padmin -I id_dsa_nsm -i POOL -e 5 -w 70% -c 80%
```

Output

```
Shared Procesor Pool Used (1.40 / 2 units entitled) - utilization on 5 mn OK: 2.16 \mbox{\$}
```

Return code: OK

check_cec_used_pool case

The check_NSM_escala_lpar shell is called using the following syntax:

```
check_NSM_escala_lpar -M HMC -H <hmc_netName> -U <user>
-I <identity_file> -N <cecname>-i POOL -e <sample_time> -w <warn>%
-c <crit>%
```

Output:

```
Processing pool (nbCPU / CPUTotal units entitled) (HMC <hmc_netname> - utilization on <sampleTime> mn <check_status>: <utilization percent>%
```

Note

The check_cec_used_pool command is based on pool_cycle metrics (total_pool_cycle, utilized_pool_cycle) obtained by the **Islparutil** HMC command.

It requires that data collection is activated for the system by the **chlparutil** command: chlparutil -r config -s 3600 [-m <systemName>]

If the **systemName** parameter is not specified, the data collection is activated for all managed systems.

Example

```
check_NSM_escala_lpar -H 192.168.207.60 -U padmin -I id_dsa_nsm -i POOL -e 5 -w 70% -c 80%
```

Output:

```
Processing pool (1.4 / 2 units entitled) (HMC 172.16.108.112) - utilization on 120 mm OK: 52.83 \mbox{\$}
```

Return code: OK

check _used_configured_pool case

The check_NSM_escala_lpar shell is called using the following syntax:

```
check_NSM_escala_lpar -M HMC -H <hmc_netName> -U <user>
-I <identity_file> -N <cecname> -p <poolname> -i POOL -e <sample_time>
-w <warn>% -c <crit>%
```

Output

Configured Shared Processing pool (nbCPU / CPUTotal units entitled) (HMC <hmc_netname>
 utilization on <sampleTime> mn <check_status>: <utilization percent>%

Note

The check_used_configured_pool command is based on pool_cycle metrics (total_pool_cycle, utilized_pool_cycle) obtained by the **Islparutil** HMC command.

It requires that data collection is activated for the system by the **chlparutil** command: chlparutil - r config - s 3600 [-m < systemName>]

If the systemName parameter is not specified, the data collection is activated for all managed systems.

Example

```
check_NSM_escala_lpar -H 192.168.207.60 -U padmin -I id_dsa_nsm -i POOL -p SharedPool01 -e 5 -w 70% -c 80%
```

Output

```
Configured Shared Processor Pool used: 0.03 / 2 Processors (HMC hmc-squad) - utilization on 5 mn OK: 1.69 \mbox{\%}
```

Return code: OK

check_lpar_status case

The check_NSM_escala_lpar shell is called using the following syntax:

```
check_NSM_escala_lpar -M [IVM|HMC] -H <netName> -U <user>
-I <identity_file> -l <lpar_name> -N <name>
```

Output

Logical partition clpar_name> on <server_name> (HMC or IVM):

Note

The check _lpar_status command is based on the Lpar state obtained by the **lssyscfg** IVM command.

Examples

```
check_NSM_escala_lpar -H 192.168.207.60 -U padmin -I id_dsa_nsm
-N ivm1 l part1
```

Output

```
Logical partition galilei on staix35 (IVM): Running
```

Return code: OK.

```
check_NSM_escala_lpar -H 192.168.207.60 -U padmin -I id_dsa_nsm
-N ivm1 l part2
```

Output

```
Logical partition tyrex on staix35 (IVM): Not Available
```

Return code: CRITICAL.

check_lpar_used_cpu example

The **check_NSM_escala_lpar** shell is called using the following syntax:

```
check_NSM_escala_lpar -M [IVM|HMC] -H <mgr_netName> -U <user>
-I <identity_file> -N <server_name> -l <lpar_name> -i CPU
-e <sample_time> -w <warn>% -c <crit>% -S <status>
```

Output

Note

The check_lpar_used_CPU command is based on cycles metrics (entitled_cycles, capped_cycles, uncapped_cycles) obtained by the **Islparutil** command (see above how to activate data collection on HMC or IVM).

Example

```
check_NSM_escala_lpar -H 192.168.207.60 -U hscroot -I id_dsa_nsm -N Pool-ESP3-PL1660R -l Coop-IBM -I CPU-e 5 -w 10% -c 20%
```

Output

Logical partition Coop-IBM on Pool-ESP3-PL1660R (1.0 units entitled - HMC 129.183.12.32 - type=Shared Uncapped Partition) - processing utilization on 5 mm $OK\colon\,0.04$

Return code: WARNING

Shared Processor Pool used (nbCPU / CPUTotal units entitled) (HMC <hmc_netname>

- utilization on <sampleTime> mn <check_status>: <utilization percent>%

4.3.2.1 check_NSM_escala_vios

The **Nagios** check commands used by **BSMEscalaLPAR Add-o**n use the shell (PERL) **check_NSM_escala_vios** command.

Usage

check_NSM_escala_vios -H <hostname> -S <hoststate> -U <remote_user> -I
<identity_file> -i <STATUS|CPU|POOL>] [-e sample_time] [-w <warn>%] [-c
<crit>%]

-H < hostname> Hostname or IP address of the VIO server to check

-U <remote user> User for remote connection

-I <identity_file> Name of the file from which the identity (private key) for RSA or

DSA authentication is read. The file must be localized into the directory <BSM Installation Directory>/engine/etc/ssh. To use it as authentication file for Vios platform, you have to install the

corresponding public key on the VIO server.

-S < hoststate> Nagios status of the VIO server host.

The status is passed by Nagios. If the status is not UP, the info is

not checked.

-i <check information> Available values are:

SEA (to check the utilization of the shared Ethernet adapters), NPIV (to check the utilization of the fiber channer adapter)

-e <sample time> Sample time in minutes used to perform calculation on utilization.

Default value is 5.

-w <warnThreshold> Warning threshold-c <criticalThreshold> Critical threshold.-h, -help Display help

Return code

OK(0), WARNING(1), CRITICAL(2), UNKNOWN(3).

Output

The output depends on the type of check performed, as shown in the examples below.

check_vios _used_sea

The check_NSM_escala_vios shell is called using the following syntax:

check_NSM_escala_vios -H <vios_netName> -U <user> -I <identity_file>
-e <sample_time> -w <warning_threshold>% -c <critical_threshold>% -i SEA
-S <hoststate>

Output

SHARED ETHERNET ADAPTERS (SEA) <check_status>: all adapters (['<adaptater_name> - <freq>Mbps - FD :<percent_use>%'],...) less than <threshold>% utilized

Example

SHARED ETHERNET ADAPTERS (SEA) OK: all adapters ('ent4 - 100Mbps - FD:0.14%' 'ent5 - 1000Mbps - FD:0.00%') less than 60% utilized Return code: OK.

check_vios _used_npiv

The check_NSM_escala_vios shell is called using the following syntax:

check_NSM_escala_vios -H <vios_netName> -U <user> -I <identity_file>
-e <sample_time> -w <warning_threshold>% -c <critical_threshold>% -i NPIV
-S <hoststate>

Output

FIBER CHANNEL ADAPTERS (NPIV) <check_status>: all adapters ((['<adaptater_name> - <freq>Gbps -:<percent_use>%'],...) less than <threshold>% utilized

Example

FIBER CHANNEL ADAPTERS (NPIV) OK: all adapters ('fcs0 - 8Gbps :0.00%' 'fcs1 - 8Gbps :0.00%') less than 70% utilized Return code: OK.

4.3.3 BSMDD4A

The BSMDD4A Add-on uses the following check command:

4.3.3.1 check_DynamicDomains

check_DynamicDomains uses the check_DD4A shell (PERL) command options:

Usage

```
check_DD4A -H <host> [-w ] [-D <domainName>]
-H, --hostname <host> Hostname or IP address of target to check
-D, --domain ALL | <domainName> ALL domains or a specific one: <domainName>
-w, --web WEB HTML output format
```

Return code

OK (0), WARNING (1), CRITICAL (2), UNKNOWN (3)

- OK All "Dynamic Domains" run normally.
- WARNING
 At least one "Dynamic Domain" is in a WARNING state.
- CRITICAL
 At least one " Dynamic Domain " is in a CRITICAL state.

UNKNOWN

All other types of processing errors (bad parameter, no response, etc.).

Note In the case of multiple errors, the global state will be the most severe one; CRITICAL > WARNING > OK.

Output

A string with a global state descriptor followed, if they exist, by the error states of the component (controller, Logical Device, Physical Device) concerned.

If $\neg D$ ALL or without $\neg D$ parameter is used, the first line displays the defined Dynamic Domains number. Then, only Dynamic Domains with issues are displayed with their status, the number of CPUs used, their CPU load (and associated threshold) and their number of tasks.

Note The global state is not displayed textually, only the command return code contains this status information.

If -D <domainName> is used, the command output displays the defined Dynamic Domain name with number of CPUs it uses, its CPU load (and associated threshold) and its number of tasks.

Examples:

- check DD4A -H <host>
- check_DD4A -H <host> -D ALL
 4 Dyn.Domains.
 domain2 : WARNING
 CPUs: 4 / 4, tasks: 70
 load: 80% (> 75%)
 domain3 : CRITICAL
 CPUs: 4 / 4, tasks: 110
 load: 100% (> 75%)
- check_DD4A -H <host> -D default
 default : OK
 CPUs: 7 / 8, tasks: 37
 load: 0.56% (< 75%)</pre>

Appendix A. Third Party License Agreement

VMware(R) Infrastructure Perl Toolkit Agreement

VMware, Inc. ("VMware") provides the VMware Infrastructure Perl Toolkit ("Toolkit") to you subject to the following terms and conditions. If you disagree with any of the following terms, then do not use this Toolkit.

- 1. This Toolkit contains a variety of materials, including but not limited to, interface definitions, documentation, sample utility applications and sample code regarding programming interfaces to one or more VMware products as referenced in such materials ("VMware Software"). This Toolkit is intended to be used to execute supplied sample utilities or to serve as a guide for writing programs to interact with the VMware Software.
- 2. Subject to the restrictions below, you may download and make a reasonable number of copies of the Toolkit contents for your personal use solely for the purpose of creating software that communicates with VMware Software ("Developer Software"). You agree to defend, indemnify and hold harmless VMware, and any of its directors, officers, employees, affiliates or agents, from and against any and all claims, losses, damages, liabilities and other expenses (including reasonable attorneys' fees), arising from your modification and distribution of the utility applications or sample code or breach of this Toolkit Terms and Conditions.
- 3. Restrictions: You may not (1) use the Toolkit to design or develop anything other than Developer Software; (2) make any more copies of the Toolkit than are reasonably necessary for the authorized use and backup and archival purposes; (3) modify, create derivative works of, reverse engineer, reverse compile, or disassemble the Toolkit, except that you may modify and create derivative works of the utility applications and sample code and distribute the modified utility applications and sample code in connection with Developer Software; (4) distribute, sell, lease, rent, lend, or sublicense any part of the Toolkit to any third party except as provided herein; (5) use the Toolkit to (a) design or develop programs to circumvent or over-ride the display of any VMware End User License Agreements to end customers and (b) design or develop software to upload or otherwise transmit any material containing software viruses or other computer code, files or programs designed to interrupt, destroy, or limit the functionality of any software or hardware.
- 4. VMware retains ownership of the Toolkit, including without limitation all copyrights and other intellectual property rights therein.
- 5. You may not represent that the programs you develop using the Toolkit are certified or otherwise endorsed by VMware. You may not use the VMware name or any other trademarks or service marks of VMware in connection with programs that you develop using the Toolkit.
- 6. If you are currently entitled to support from VMware, you may submit a support request for installation assistance of this Toolkit and assistance in executing unmodified utility applications provided with this Toolkit. Except as provided herein, you are not entitled any VMware support for this Toolkit or any other services from VMware in connection with this Toolkit.

- 7. Term, Termination and Changes: This Agreement shall continue as long as you are in compliance with the terms specified herein or until otherwise terminated. You and or VMware each may terminate this Agreement for any reason at any time. You agree, upon termination, to destroy all copies of the Toolkit within your possession or control. The Confidential Information, Limitations of Warranties, Liability and Indemnification sections set out in this Agreement shall survive any termination or expiration of this Agreement.
- 8. Limitations of Warranties and Liability: THE TOOLKIT IS PROVIDED "AS IS" WITHOUT ANY WARRANTIES OF ANY KIND. TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, VMWARE DISCLAIMS ANY IMPLIED WARRANTIES, INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NON-INFRINGEMENT OF INTELLECTUAL PROPERTY RIGHTS.

TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, IN NO EVENT WILL VMWARE BE LIABLE FOR ANY LOST PROFITS OR BUSINESS OPPORTUNITIES, LOSS OF USE, BUSINESS INTERRUPTION, LOSS OF DATA, OR ANY OTHER INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE TOOLKIT OR YOUR USE OF THE TOOLKIT, UNDER ANY THEORY OF LIABILITY, WHETHER BASED IN CONTRACT, TORT, NEGLIGENCE, PRODUCT LIABILITY, OR OTHERWISE. BECAUSE SOME JURISDICTIONS DO NOT ALLOW THE EXCLUSION OR LIMITATION OF LIABILITY FOR CONSEQUENTIAL OR INCIDENTAL DAMAGES, THE PRECEDING LIMITATION MAY NOT APPLY TO YOU.

VMWARE'S LIABILITY ARISING OUT OF THE TOOLKIT PROVIDED HEREUNDER WILL NOT, IN ANY EVENT, EXCEED US\$5.00.

THE FOREGOING LIMITATIONS SHALL APPLY TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, REGARDLESS OF WHETHER VMWARE HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES AND REGARDLESS OF WHETHER ANY REMEDY FAILS OF ITS ESSENTIAL PURPOSE.

9. These terms are governed by the laws of the State of California and the United States of America without regard to conflict of laws principles. You may not assign any part of this Agreement without the prior written consent of VMware. Any attempted assignment without consent shall be void. These terms constitute the entire agreement between you and VMware with respect to the Toolkit, and supersede all prior written or oral communications, understandings and agreements. Any waiver of these terms must be in writing to be effective. If any provision of these terms is found to be invalid or unenforceable, the remaining terms will continue to be valid and enforceable to the fullest extent permitted by law.
